quantity of and place properly the chief factor making for soil fertility. earth, the factors above mentioned. Our prairie and newly cleared soils contain immense quantities of this

material. Exposure to heat and the intermixture of earthy matter serve to waste. Thus, repeated grain cropping with deep ploughing provide the conditions best calculated to dissipate this matter most rapidly and most effectively.

Its Functions. The functions of this common, yet easily lost, substance are varied and important. Being, as anyone can find out for himself, of the nature of a sponge, it retains the moisture in a dry times but will allow all superfluous water to rapidly and harmlessly percolate to the lower soil

It holds loose, porous solls together, and so otherwise 100se sands become staple and provide a good root hold for plants. It renders dense, impermeable soils open and porous, permitting the free circulation of air and water and allowing the weak rootlets to penetrata the erstwhile impenetrable space in search of food, In brief, it is the chief requirement of good physical condition in our soils. It contains much plant food, since it is really vegetable matter, and a large percentage of this food is in available forms. It aids also in the conversion of the non-available forms of the eleforms. Further it retains near the
