Flies That Pester.

The presence of flies in the house from a high hygienic standard, for places free from flies. Poisonous flypapers are unsightly, and glutinous cords and traps are not very pleasant accessories in the household. Yet it is a matter not only of comfort, but also of health that the fly should be excluded. The fly may easily be a pathogenic agent owing to the fact of its choice of environment being oftentimes of the most disgusting character. When a fly walks across a sustable culture medium it leaves infection behind it, as shown in the colonies of organisms, which develop on the points with which the insect's legs have been in contact. The fly, therefore, should be driven out of our haunts.

It is a curious fact that flies will not pass through netting even though the meshes be quite large unless there be a source of light, as from a window, behind it. Thus in rooms with windows only on one side a net over the window will absolutely keep the flies out, although the meshes of the net may be an inch apart.—From the Lancet,
