BEHIND THE SCENES IN A BIG HOTEL.

Wonderful System by Which the Great Public is Cared for-What Must be Done When You Order Your Meals.

Too many cooks may spoil the perfect form of each loaf. On the broth in some kitchens, but they do ice-cream side of the room is not in the kitchen of a big modern long, tow table, with the tops of hotel. The kitchen is the hub around the packing freezers coming through which every well-conducted hitel re- it. Eeven kinds of ice-cream are volves. On it depends the reputation of the house, and much of its popularity, and on it rests a responsibility that is felt by every man connected withn it, from the chef in his huge white cap and spotless apron down to the numble errand boy, says the

Kansas City Journal. The side of a big hotel that the public sees is interesting enough, the place itself is attractive, and there is always something interesting in watching people who know their work and do it. But the most interesting part of it all is the part the public never sees, the kitchen, with its spotfess floors and tables, its rows and rows of shining silver. disnes, and cooking utensils, its piles of tempting food, its delicious smells,

But before one can thoroughly understand the workings of the kitchen there are several other places tribsmelling place, this wine cellar, but not absorb one's attention. There for that matter there isn't any place is a silver room, where ten girls around this lower floor of the hotel are kept busy "rubbing up" every that isn't good-smelling. The temper- piece of silver as it comes from the ature in the cooling room is not very far removed from zero. Here the liquor intended for immediate consumption is kept, a day's supply at a time. And-if you are a member of a temperance society, don't go to that room. It will discourage you. After leaving the Baltimore's wine celiar, which isn't a callar at ali, ly be termed "the hot room." This by the way, but a room just like the others, one comes out into the storeroom from which the cold storage) rooms open. This storeroom reminds one of a grocery store in full blast, the steward, G. A. Keiley, and his assistants are hustling about or pouring over big important looking books in which every round of food that comes in and goes out of their hands is checked up and kept count of. The walls to the ceiling are are lined with shelves full of fine canned stuff and foreign labels, and bottles of relishes and rackages of breakfast food and things. "This is just the immediate supply," Mr. Kelley volunteers, unconcernedly, "most of what we keep on hand is in the big storeroom." The first cold storage place is the poultry room, in charge of the coultry butcher, who puts in ail his time preparing chickens and turkeys and ducks and fowls of every kind for the cook. What this means can be better understood when it is stated that the Baltimore uses 250 pounds of turkey a day, and other poultry in like proportion. Five There are huge kettles, innumberable question, "Is this the only inhabited or six dozem broiling chickens are used every day, and almost as many There are regular hay stacks of ducks. Some of the bottles lobsters, anything that one could must stand on their sides, some on ask for in the cold meat line. At their heads, and still others would the opposite end of this long room be utterly ruined if they did not are a lot of other things of interstand on the bottom that the botle- est; that is, they would be if the maker provided for them. It is a good- food that one sees everywhere did dish washers that would be a revelation to the weary housekeeper; there is the glass room where two girls are spending their lives "doing" glassware, and half a dozen other apartments that lose all interest, however, after one has once gone into what might quite properis where the real work of the kitchen goes on. The ranges occupy the foreground in this good smelling place, a continuous row, of them the entire length of the room. They are growing with heat, and sizzling with good things. Three of these ranges haae broilers on top, and during the busy hours three men are kept busy there broiling steaks and chops. One man devotes his time and attention to cooking eggs. An ingenious and convenient device is an automatic egg boiler, which works something on the same plan as an alarm clock, only at the time set, instead of going off, it hoists the egg up out of the water. Soups are not made by the kettleful or in any such modest way as that, but by the vatful, for all the standard kinds and by huge kettlefuls probabilities; beyond it nothing. All the for the fancy kinds. Not fewer than amazing progress of modern science, all a dozen kinds of soups are kept | the revelations made by the spectroconstantly ready for serving.

Life on Other Planets.

Upon the question whether life-bearing planets can exist in other solar spstems than our own the answer of science is clear and distinct. It is precisely the same which Prof. Newcomb recently gave concerning the possible inhabitants of Mars: "The reader knows just as much of the subject as I do, and that is nothing at all." Within our solar system can indeed form some crude estimate of scope or by photography, all the advance in biology have not brought us one step nearer in answer to the world?" Sir of suffering humanity, the Dispatch the efficiency of such a specific of simple character and readily attainable under competent medical ad-

> physician of Pittsburg, reading over some flies of a medical journal half a dozen years earlier in date, came across a letter from a New England country physician, stating the extraordinary success which he had experienced in breaking up typhoid fever in its early stages by small doses of largely diluted carbolic acid Medical science was then prejudiced against such a treatment by its belief that an antiseptic condition of the internal organs could not be induced. The Pittsburg physician was, however, impressed by the theory of sterilizing the infected system and relieving it of the poisonous germs. He commenced to test it, and seven years' experience has convinced him of its efficacy. He has not, as we understand, lost a case where this treatment was applied in its early stages, and even where the disease has advanced to later stages the remedy has almost universally proved efficient. Two members of the Dispatch force have experienced, either in their persons or their families, the value of this treatment. Within the past ten days a severe case in which the temperature was over

104 has been brought down to 99. The dose of carbolic acid given in this treatment is from five drops for an adult-and even up to ten in severe cases-down to one or two drops A good, well-formed chin is essen- for small children, given every two tial to creative genius, energy and or three hours in ordinary cases and enterprise.
