#### BEHIND THE SCENES IN A BIG HOTEL.

Wonderful System by Which the Great Public is Cared for-What Must be Done When You Order Your Meals.

broth in some kitchens, but they do ice-cream side of the room is hotel. The kitchen is the hub around which every well-conducted hitel revolves. On it depends the reputation of the house, and much of its popularity, and on it rests a responsibility that is felt by every man connected withn it, from the chef in his huge white cap and spotless apron down to the numble errand boy, says the

Kansas City Journal. The side of a big hotel that the public sees is interesting enough, the place itself is attractive, and there is always something interesting in watching people who know their work and do it. But the most interesting part of it all is the part the public never sees, the kitchen, with its spotless floors and tables, its rows and rows of shining silver, disnes, and cooking utensils, its piles of tempting food, its delicious smells, and its score of white-aproned work-

But before one can thoroughly understand the workings of the kitchen there are several other places tributary to it that must be visited. It is just a step down from the lobby, with its lights and its luxury and its leisure, to the damp, cool celars and storerooms. The wine cellars come first, two of them, one for storage wise cellars, but to the uninitiated a time. And-if you are a member ! that room. It will discourage you. After leaving the Baitimore's wine by the way, but a room just like the others, one comes out into the storeroom from which the cold storage ) rooms open. This storeroom reminds one of a grocery store in full

biast, the steward, G. A. Keiley, and his assistants are hustling about or pouring over big important looking books in which every round of food that comes in and goes out of their hands is checked up and kept count oi. The walls to the ceiling are are fixed with shelves full of fine canned stuff and foreign labels, and bottles of relishes and packages of break fast food and things. "This is just the immediate supply," Mr. Kelley volunteers, unconcernedly, "most of what we keep on hand is in the big storercom." The first cold storage rlace is the poultry room, in charge of the coultry butcher, who puts in all his time preparing chickens and turkeys and ducks and fowls of every kind for the cook. What this means can be better understood when it is stated that the Baltimore uses er joultry in like proportion. Five There are huge kettles, innumberable question, "Is this the only inhabited may be balanced by the strength of writer, the chin is small , weak or reor six dozem broiling chickens are and as many good, steamy smells; use 'every day, and almost as many There are regular hay stacks of

This is where the real work of the kitchen goes on. The ranges occupy the foreground in this good smelling place, a continuous row of them the entire length of the room. They are growing with heat, and sizzling with good things. Three of these ranges haae broilers on top, and during the busy hours three men are kept busy there broiling steaks and chops. One man devotes his time and attention to cooking eggs. An ingenious and convenient device is an automatic egg boiler, which works something on the same plan as an alarm clock, only at the time set, instead of going off, it hoists the egg up out of the water. Soups are not made by the kettleful or in any such modest way as that, but by the vatful, for all the standard kinds and by huge kettlefuls probabilities; beyond it nothing. #### Life on Other Planets.

Upon the question whether life-bearing planets can exist in other solar spstems than our own the answer of science is clear and distinct. It is precisely the same which Prof. Newcomb recently gave concerning the possible inhabitants of Mars: "The reader knows just as much of the subject as I do, and that is nothing at all." Within our solar system can indeed form some crude estimate of scope or by photography, all the advance in biology have not brought us of an individual's character, the well as in other matters. one step nearer in answer to the weakness of an undeveloped feature If, according to a well-known world?" > > Some seven years ago a practising physician of Pittsburg, reading over some files of a medical journal half a dozen years earlier in date, came across a letter from a New England country physician, stating the extraordinary success which he had experienced in breaking up typhoid fever in its early stages by small doses of largely diluted carbolic acid Medical science was then prejudiced against such a treatment by its belief that an antiseptic condition of the internal organs could not be induced. The Pittsburg physician was, however, impressed by the theory of sterilizing the infected system and relieving it of the poisonous germs. He commenced to test it, and seven years' experience has convinced him of its efficacy. He has not, as we understand, lost a case where this treatment was applied in its early etages, and even where the disease has advanced to later stages the remedy has almost universally proved efficient. Two members of the Dispatch force have experienced, either in their persons or their families, the value of this treatment. Within the past ten days a severe case in which the temperature was over 104 has been brought down to 99. The dose of carbolic acid given in this treatment is from five drops for an adult-and even up to ten in sev-
