w it be-

(From the Canadian Farm.) The hot weather period is the most trying season in the life of the young calf. It should not be so if it were properly looked after. But, as a rule, the young calf is very much neglected at this season. It is left a prey to flies, the heat of the sun, and soon becomes stunted, its hair rough, and its general ep pearance unthrifty. The symmetry of outline present when a week or two old has given way ot a rotundity of body, familiarly known as "pot bellied." When a calf reaches this condition it might better be turned to other purposes than the dairy. The value of the calf is depreciated one-half when it becomes stunted in growth, and no matter how good its ancestry may be, it cannot reach the development that it would have had, had proper feed and care been extended to it every day of its growth."

CAN CALVES BE RAISED WITHOUT MILKY

There are more calves of this stunted character in the country than many imagine. The cheese factory and the supplying of whole milk to cities and towns are some of the factors contributing to this end. Where the whole milk is diverted from the farm it is difficult to raise calves properly. Good calves have a calf is in a paddock conveniently lo- dustry. The appendices to the present been raised, without milk, except for the cated for feeding, where there are trees volume will be found more than usually ation, relieves the superheated body. first two weeks. Some experiments con- and a small shed for shelter. If this serviceable, especially that in which are ducted at the Pennsylvania Experiment cannot be provided then the calves collected from the most authoritative what the automatic sprinker is to the Station a few years ago showed that should be kept in a box stall in the sources the facts showing Britain's factory or warehouse. SKIM-MILK FOR CALVES. Premising that the calf being raised this season have had proper care and feeding up to the present, we have reach- termilk or whey; wean at 4 to 6 months. ed a period when they are from three to Place hay or forage within reach as soon four months old. At this age they should still be receiving some skim-milk daily. to keep the food rich in bone and flesh And we might point out just here that skim-milk is a better food for the calf intended for the dairy than whole milk. VALUE OF SPRAYING DEMON-It should have whole milk for a couple of weeks. Then a gradual change to skim-milk should be effected so that when three or four weeks old it should not be receiving any whole milk. Skimmilk is rich in protein, which will develop muscle, bone and sinew, thus laying the foundation for a strong, healthy, vigorous animal. But skim-milk alone is not sufficient. Some linseed meal should be supplied, about a cupful to such feed. The jelly is simply made by stirring ground flax seed or linseed meal into a pot of boiling water, until a jellylike consistency is reached.

One of the troubles in calf-rearing i scours. A little flour added to the linseed meal along with the skim-milk, is a good preventative. But by this time calves will have got beyond the scouring

HOW MUCH TO FEED.
