Heavy soil underlaid with porous subsoil or sandy soil underlaid with non-TO one need expect to argue farmers out of grain raising, although | porous subsoil is the proper combinathat is not the most profitable Taking the great run of soils the agriculture. It is possible, however to show owners of land that it is

just as easy to grow thirty bushels of sary to add to them. wheat, 100 bushels of corn or 300 bushels of potatoes on an acre as it is grow lean and miserable crops. It is form of basic slag phosphate or phossimply a question of management and | phate rock; the humus by the green not specially of hard work.

Until a crop of wheat amounts to fifteen bushels an acre there is no profit whatever at average prices. Above fifteen bushels it is practically all profit. Here is the incentive to raise reasonably large crops. The corn average is only twenty-eight bushels an acre, whereas it ought to be 100. The potato average is 100 bushels, but it ought to

be 200. There must be the right succession of crops in the fields, the so called rotation. There must be the money making proportion between grass land and gen. crop land and live stock in proportion

While these facts are vital to all pro- humus content increased. ducers, it seems to have become the duty of the small farmer to blaze the way for a more intensive and scientific kind of agriculture.

The use of a large amount of manure does not necessarily mean bigger yields and net profits. Something more than, manuring is required—the soil must be worked better and weeds destroyed. There must be right proportion and

quantity of plant foods. It will not do to guess that they are in the soil, for it must be proved. If the test shows the quantity lacking and proportion wrong the farmer cannot make money. Nonporous subsoil under heavy, close soil is bad, as is porous subsoil under sand.

************************* TAKE AN INVENTORY.

Do you take a semiannual inventory of your property so you know the increase or decrease of value, also to base your claims in case of fire? An inventory on the farm is important. Be fair with yourself and others when placing the valuation.-National Stockman and Farmer.

VALUE OF THE HEMLOCK.

Bark For Tanners' Use and Lumber Are Products of the Tree.

Hemlock has always been an important source of tanning material on account of the tannic acid in its bark. While there are now many substitutes, large quantities are still used, and the bark of a hemlock forest may furnish a considerable revenue; hence, in order. to estimate the total value of a hemlock stand, it is necessary to be able, to determine the amount of bark as well as that of lumber.

Wherever hemlock seed trees are plentiful reproduction is usually fair. It does not, however, take possession of old pastures as do the pine and spruce, and it is practically never found on the burns on the mountains,

Photograph by Vermont agricultural experiment station.

THRIFTY HEMLOCK LEFT FOR THE PROTEC TION OF A WATERSHED, ALTHOUGH MA-

where poplar, birch and spruce are so

common. Hemlock, however, seems to possess the ability to reproduce on a hardwood litter of leaves better than does either pine or spruce, and frequently young hemlocks are seen starting under old hard woods.

But, while there is a rather small reproduction of hemlock, there is atmost no second growth in the stage so commonly found of spruce and pine; hence figures of the increase of second growth hemlock are entirely lacking. Indeed, it is doubtful whether there will ever be another growth of any account to take the place of the old trees.-Bulletin of Vermont Agricultural Experiment Station.

Work For Wintry Days. The wood lot offers a place where the farmer may turn wintry days into profit, cutting wood, having lumber and posts sawed and clearing up land now worthless.
