HENS ARE NOW LAYING

By Lighting Pens Till 9 p.m. Egg Production Nearly Doubled.

Cause, Symptoms and Cure of Ringworm Explained—As It Is Very Contagious the Stockman Must Take Great Precautions to Prevent Its Spread.

(Contributed by Ontario Department of Agriculture, Toronto.)

MOSTLY everybody who is keeping poultry wants to get eggs in winter. Generally speaking, the number of eggs gradually goes down from week to week from September to January and then there is a slow but gradual increase until March, April

and May, which in Ontario are the best months for egg production.

It is unusual, and in most cases very unwise, to publish figures in regard to experiments until the material has been very thoroughly tested, but in this particular case, considering the high cost of feeds and the general scarcity of new laid eggs, we are giving the figures on a rather short test of but four weeks' duration. The results appear to be generally true in all pens tested and are in accord with results obtained elsewhere.

The increase in egg yield has been obtained by the use of electric lights, or prolonging the day. The facts of the matter appear to be that a hen's crop is too small a reservoir to hold sufficient feed for the long night. A hen, to lay, must have a surplus of feed over and above that required for body maintenance.

In these particular trials, the results of which are given below, the lights were turned on at dusk and were turned off at nine o'clock at night. The birds set their first feed in the morning at seven o'clock and a few dull mornings require lights for about one hour.

The usual feed of grain given at about four to five o'clock in the afternoon is missed or only a handful or two of grain is given to twenty-five birds, simply to keep them moving a little. The full feed is given at about eight o'clock.

The following results have been secured:—

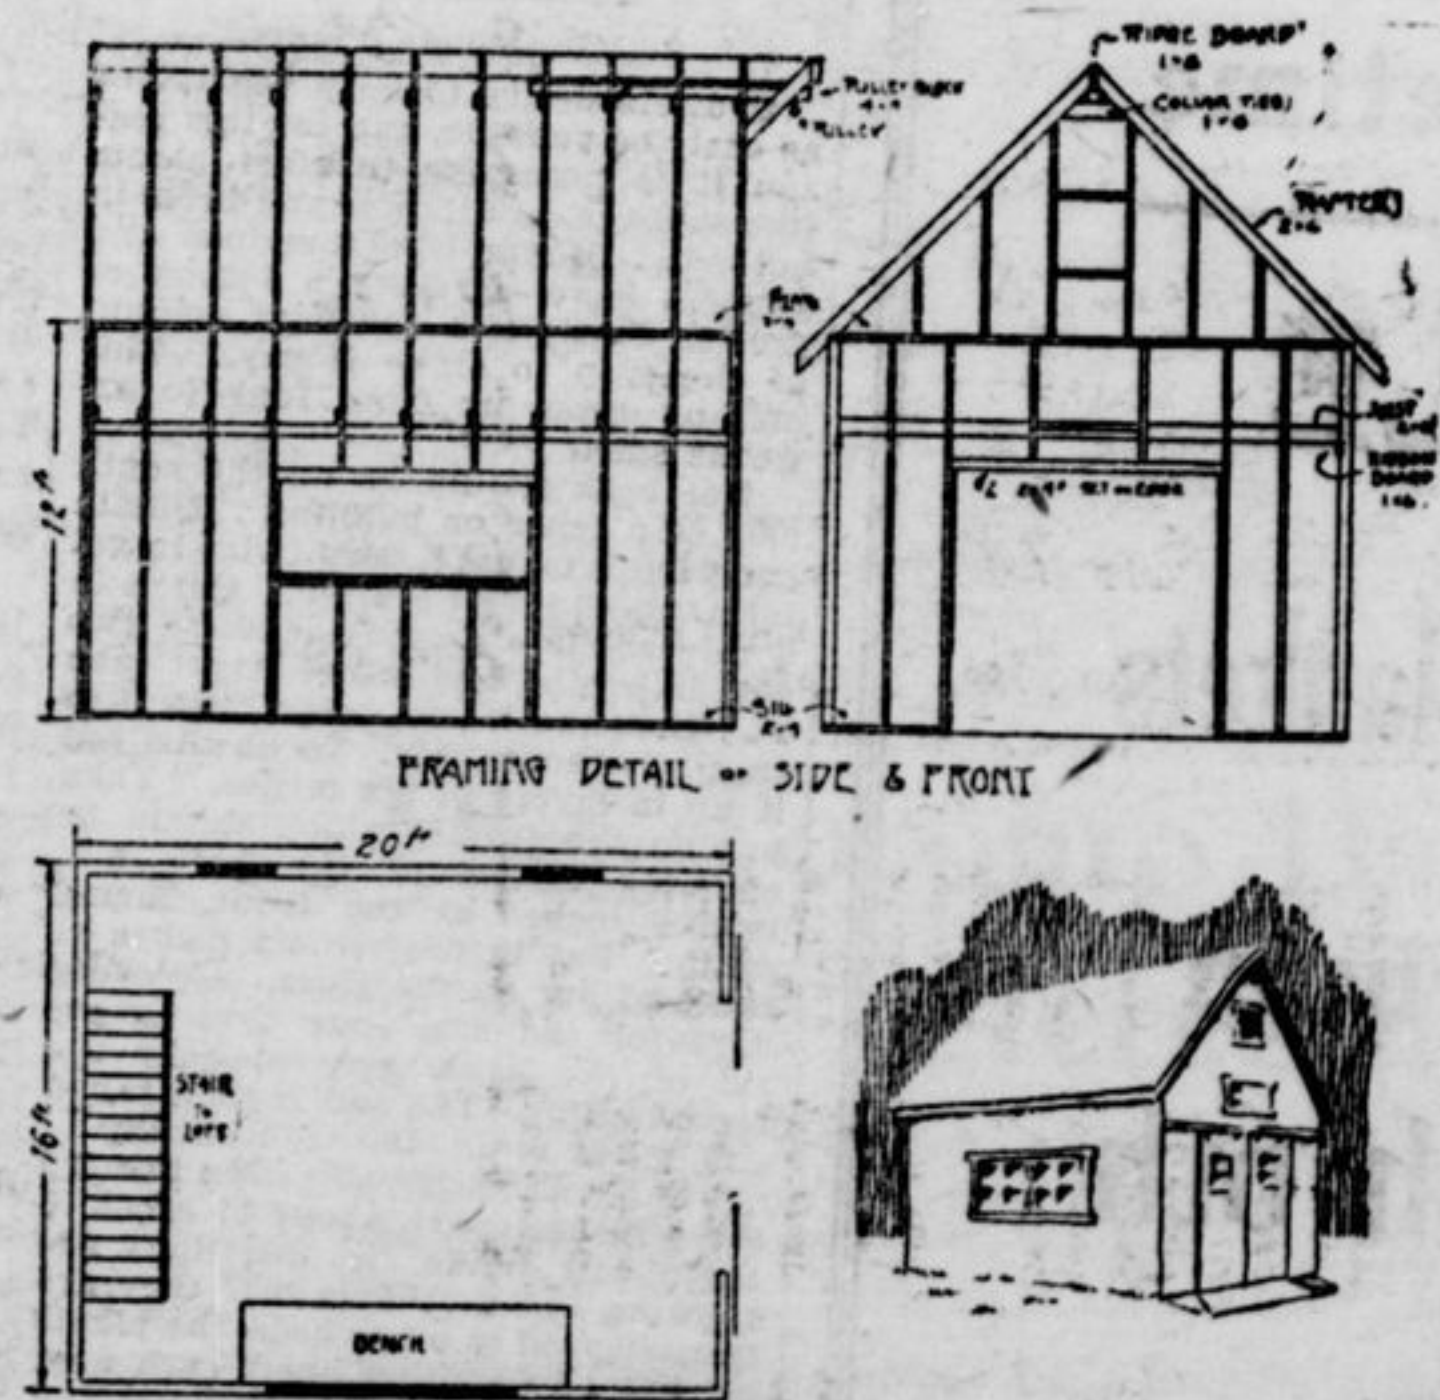

No. of birds.	Eggs laid week beginning	No. of birds.	Eggs laid week beginning
50 April hatched	13th. 20th. 27th. 4th.	50 April hatched	13th. 20th. 27th. 4th.

There are many people keeping poultry who have no electric lights. Fair to good results have been secured elsewhere by using ordinary kerosene lanterns. The danger of the kerosene lantern is that it is really an increase. We have not tested these as yet but hope to have them under way soon. For electric lighting we use three ordinary bulbs for a pen of one hundred birds, or one light in a twenty-five bird pen. Prof. H. W. Graham, O. A. College, Guelph.

A FARM WORKSHOP.

Plan of a Handy and Inexpensive Workshop Which May Be Built by Any Farmer. See Accompanying Article for Details.

The progressive farmer recognizes the need of a small building where he can overhaul, paint and repair his farm equipment in the most expeditious manner. Such a building must be compact and conveniently arranged with a floor space that will accommodate any of his larger machines. The floor should be of concrete to stand the wear and tear. In making the floor it will be necessary to place the anchor bolts, to which the sill is fastened, before the concrete has set. The work bench, forge and heater must be so placed that the centre of the floor is left clear, but the bench and anvil must be well lighted. The placing of the long window will depend upon which side of the shop receiving the best light. Stairs lead through a trap-door to the loft, where the lumber, etc., is stored. This loft is lighted with a window at each end, and it also has a small door at the front, on a level with the floor.

Material Required to Build Shop.

No. of Pieces.	Thickness in Inches.	Length in Feet.	Number of Feet.
Plank and sill	2 1/2	24	60
Plank	2 1/2	24	44
