ROUMANIA RUINED BY HUN RAVAGES

LACK OF TRANSPORT AT ROOT OF DUFFICULTY

Scientific Methods of Germans in Work of Pillage Leaves Country in State of Utter Destitution.

With the exception of Serbia, Roumania certainly has suffered more than any of the Allies. Only the incomparabit natural resources of the country made it possible to ward off famine, but devastation and pillage were as complete as German unscrupulousness and scientific methods could make them.

Everything has been taken, essentials of life and labor, with even greater malice than in Belgium, for here the Germans had what they thought was justification in punishing a country which, although economically completely dependent on Germany, had dared to take up arms on the side of the Allies. They spent two years systematically transporting to Germany everything they fancied-furniture, silverware, clothing, machinery, food and livestock. They sent 2,500,000 tons of cereals in railway trucks, but they have sent another 1,000,000 tons in paper packages. Every soldier was allowed five kilos of cereals for home every little while. The year of 1918 was a bad crop year in Wallachia, but the Ger-

country, nothing so seriously crip- 3 sizes, 16 to 20 years. Price, 25 irrigate, by means of two thousand ing tissue. pled Roumania as the means of cents. transport. There are in the whole kingdom only eighty-four engines in fit condition. All the horses and most of the oxen were taken. Telegraph and telephone wires are mostly down, and there is no material available to repair them, which, together with the lack of train service, makes it difficult to obtain comprehensive information about the food situation.

Seed Grain Badly Needed. There is a difference of opinion as the the quantity of foodstuffs now in the country. After consulting various people, including the Allies, who have had the matter under examination, it is safe to say there is sufficient food available if there were any means of transporting it from one point to another. The Government, however, is not of this opinion. The Minister of Industry and Commerce, M. Constantinesco, says the present supplies will hold out until the end of April, and unless the Alties manage to get seed here this month there will be virtually no harvest, as the Germans carried off all seed grains. Four Allied trains so far have arrived, carrying 26,000 tons of flour, which is already distributed in spite of the overwhelming difficulties of broken bridges and lack of transport. In the whole of Bessarabia, for instance, there are only nine engines and, as the tracks there are wider than those in Roumania, it is impossible to send engines from here.

Until transport questions are settled nothing can be done. Two hundred locomotives would bring relief at the present moment than any at a loss to understand how it was gion in all directions, taking meaamount of food, badly as this is that insects were enabled to so quick- surements and noting the rises and

A MARTYR TO SCIENCE

Major Gibson Died While Discovering the Germ of Influenza.

in February, in Abbeville, France, it odor. And besides this, each bee has studied their banks, their beds, ascerscience almost at the hour when with its passport into its own particular and during flood.

the workers Major Rowman home. and Capt. Connor of the Australian Army Medical Corps, he had completed the discovery of what is probably the causative germ of the influenza epidemic.

A preliminary note regarding this germ was published on Dec. 14, 1918, in the British Medical Journal, and thus Major Gibson's work takes precedence over late publications.

At that time his work of discovery was not complete. It now has been finished, and Major Gibson's death has furnished a part of the evidence that his enthusiasm led him to work so hard that he finally fell a victim to a virulent strain of the germ with which he was experimenting. He caught influenza and pneumonia followed.

The germ belongs to the order of filter passers and is grown by the Noguchi method. It is reported that monkeys have been infected and easily have developed attacks producing small hemorrhages. The chain of

evidence seems strong. It was observed recently that persons working in gas works seemed to possess a degree of immunity from the disease. Although it raged around them they themselves escaped in a large measure. At the time it was noted that in a certain room of a munition factory influenza did not develop, though persons working in other rooms got it. An analysis of the air in these places revealed that it contained a concentra-

tion of the fumes of sulphurus acid. This led to setting up steam chambers similar to those employed to disinfect carriers of cerebrospinal fever. The results have been fully up to expectation so far. There is no reason why disinfecting stations should not be set up for the public where the benefit by the new method might be obtained at small cost. ISSUE No. 11—'19
