THE CONTROL OF WEEDS

Measures and Methods for Getting Rid of Them.

Education Must Accompany Legislation—Farmers Like to Be Shown—Results of Experiments on Over Seventy Farms.

IN Ontario two methods have been tried for the control of noxious weeds, namely legislation and education. Under legislation there is "The Act to prevent the spread of Noxious Weeds." The main clauses of this act are as follows: "Every occupant of land, or if the land is unoccupied, the owner, shall cut down or destroy all Canada Thistle, Ox-eye Daisy, Wild Oats, Ragweed, and Burdock growing thereon and all other noxious weeds growing thereon to which this act may be extended by bylaw as hereinafter provided, so often in every year as is sufficient to prevent the ripening of their seed, if such cutting or destruction does not involve the destruction of growing grain.

"The council of any local municipality may, and upon a petition of fifty or more ratepayers shall, appoint at least one inspector to enforce the provisions of this act in the municipality, and fix the amount of remuneration, fees, or charges he is to receive for the performance of his duties; and if a vacancy occurs in the office the council shall fill the same forthwith.

"Any person who knowingly sells or offers to sell any grass, clover or other seed, or any seed grain amount which there is the seed of Canada Thistles, Ox-Eye Daisy, Wild Oats, Ragweed, Burdock, or Wild Mustard shall for every such offence incur a penalty of not less than \$5 and not more than \$20.

"Any person who sows any wheat or other grain knowing it to be infested by the disease known as smut without first using some proper and available remedy to destroy the germs of such disease, shall incur a penalty of not less than \$5 and not more than \$20."

A few years ago an investigation was made into the effectiveness of this act and it was found that out of the six hundred townships of Ontario, only ninety-two were making any effort to enforce it. In forty-nine only had inspectors been appointed. In regard to the work of inspectors, seventeen townships reported the work of the inspectors as satisfactory; fourteen reported that the work was partially satisfactory. Out of the six hundred townships of the province, fifteen reported that this act was successfully enforced; seventy-two that it was partially enforced; and the remainder reported that it was practically a dead letter. It would seem from this investigation that legislation having but little effect in the control of weeds in Ontario.

Legislation without education is, in the opinion of the writer, useless. It is only when the sentiment of those concerned is behind an act that it can be successfully enforced and such sentiment can be created only by proper education.

In regard to education, considerable has been done by the Ontario Agricultural and Experimental Union. This organization in co-operation with the Department of Botany at the Ontario Agricultural College has carried on, during the past eight years, co-educative experiments in weed eradication. Over seventy farmers have conducted successful experiments with were—Perennial Sow Thistle, Twitch Grass, Bladder Campion, Cow Bell, Wild Mustard, Ox-Eye Daisy, Field Bindweed, Wild Oats and Chess.

The objects of these experiments is to get data from which definite statements may be made regarding the best methods of controlling the various bad weeds. It is hoped to include more weeds each year until exact information has been obtained concerning the eradication of most of the bad weeds in the province.

The results of this work are presented each year at the annual meeting of the Experimental Union at Guelph and the more important results are published in the annual report.

Six of these experiments have now been carried on for eight successive years, and some very valuable information obtained regarding the control of such weeds as Perennial Sow Thistle, Twitch Grass, Bladder Campion, and Wild Mustard. This information may be briefly summarized as follows:

1. That good cultivation followed by rape sown in drills provides a means of eradicating both Perennial Sow Thistle and Twitch Grass.
2. That rape is a more satisfactory crop to use in the destruction of Twitch Grass than buckwheat.
3. That rape gives much better results in the eradication of Twitch Grass and Perennial Sow Thistle when sown in drills and cultivated than it does when sown broadcast.
4. That thorough deep cultivation in fall and spring followed by a well cared for hoed crop will destroy Bladder Campion.
5. That mustard may be prevented from seeding in cereals, wheat or barley by spraying with a twenty per cent. solution of iron sulphate without any serious injury to the standing crop or to fresh seedlings of clover.

In addition to this experimental and educational work of the Agricultural and Experimental Union, the Department of Botany has carried on various experiments in the eradication of many of the worst weeds of the province.—Prof. J. E. Howitt, O. A. College, Guelph.

MAKE COTTAGE CHEESE

Farmers and Townsfolk May Easily Have Their Own.

A Nutritive and Inexpensive Food—May Be Made From Sour or Skimmed Milk—Methods of Preparation Described.

HERE are a great many kinds of cheese made in the world, but the easiest to make is cottage cheese.

A person living on a farm where there is a supply of milk can make not only for their own table but for market as well, while the towns-dweller who buys milk by the quart can use up small amounts left over in exactly the same way.

There is no need of wasting milk in the home just because it has become sour. It is true that small amounts of sour milk are often used when baking, but a person may not wish to use all of it in that way.

It is not necessary to use whole milk for making cottage cheese. Skimmed milk is quite satisfactory, and a small amount of cream may be added to the curd at the time of adding the salt.

There are two methods used in making cottage cheese, the "rennet method" and the "ordinary" or "heating method." We will speak of the heating method, as it is the one most commonly used in Ontario.

To make good flavored cheese it is necessary to have good clean flavored milk free from taints or odors. Have the fresh skimmed milk at a temperature of 65 to 75 deg. F. It can be allowed to sour naturally, or a small amount of good flavored sour skimmed or buttermilk may be added to hasten the souring and help control the flavor.

Allow the milk to stand undisturbed until it has nicely thickened when it will be ready for the next step of the process. Stir the coagulated milk to break it up evenly, then carefully heat it to separate the curd from the whey.

If only a small amount is being heated it may be placed in a double boiler. A larger quantity may be heated in a can or pail, while a cheesevat is suitable for large quantities. If the water in the vessel surrounding the milk is kept between 140 and 150 deg. F. there will not be the danger of overheating or heating too quickly, which is often the case when the water is boiling.

There is usually a good separation of curd and whey when it is heated to a temperature between 90 and 100 deg. F. If the whey should not be clear when the temperature reaches 100 deg. do not heat higher, but allow the can to stand. The whey will likely become clear in a few minutes.

Avoid overheating the curd as it causes the cheese to be dry and crumbly.

Next, drain the curd. It may be hung up in cotton bags or it may be drained on cheesecloth placed over a rack or strainer.

When the free whey has drained away lift the cloth at one side and allow the curd to roll to the centre, then do the same with the other side. This will hasten the drainage. When sufficiently drained the curd should be salted, using about an ounce of salt to four or five pounds of cheese.

If the cheese were made from skimmed milk it will be necessary to add a little cream. About an ounce of cream for each pound of cheese will be sufficient.

After thoroughly mixing allow it to stand a little while for the salt to dissolve before putting it up in packages.

If a person were making a quantity it might be put up in pound packages by printing it with the butter-printer and wrapping in parchment paper. This is an inexpensive way of handling cottage cheese, but it is not as attractive as the little fibre containers coated with paraffine.

A person who is making butter on the farm might increase the returns from the dairy by making some cottage cheese each week, as there are many people who like cottage cheese but do not know where to get it. Cottage cheese is a food that is nutritious yet inexpensive and much more of it might be used.

Like all other foods, we find people who like it and those who do not, but in many cases the addition of some flavoring has made it acceptable.

Cottage cheese may be used in many ways. It may be eaten with cream and sugar, preserves or maple syrup, or an attractive dish may be made by making a nest of cottage cheese and placing a bit of jelly in the centre. Or it may be flavored by the addition of chopped nuts, olives or pimientos and moulded into any desired shape.

A small box has not a mould, a small box may be lined with waxed paper and the cheese packed in with a knife or spoon. When filled, fold over the ends of the papers and shake the cheese out of the box. Cottage cheese sandwiches are popular. A very simple salad is made by placing on a lettuce leaf a small mould of or a heaping tablespoonful of cottage cheese then adding salad dressing; or a more fancy salad may be made by making the cheese into small balls and rolling them in chopped nuts. Cottage cheese may also be used as a sandwich filling by mixing it with chopped nuts, celery or dates or any other flavoring that may be desired. Many recipes could be given for utilizing this dairy by-product, cottage cheese, but sufficient has been said to suggest its possibilities.—Miss Belle Miller, O. A. College, Guelph.

FARM HELP

Owing to unemployment in centres of population there are many men now available for farm work. A large number of these men have had farm experience and their services are now available at moderate wages with board. Farmers who can usefully employ one or two of these men at this time will be rendering a service to the community as well as to themselves. Many farmers have repairs and other jobs which have been put off for years on account of the high cost of labor. This might be a good time to get caught up with work of this nature.

Farmers desiring help please communicate with your local representative and state the nature of the work and wages you are willing to pay.

T. Stewart Cooper, Markdale
 Agricultural Representative Co. Grey
 Hon. Manning Doherty, Min. of Agriculture

ROB ROY MILLS, Limited

GRAIN WANTED

We are in the market for any quantity
 Milling Oats, Feed Oats, Barley
 Peas, Buckwheat and Mixed Grain
 and we are paying carload prices for the next few days.

If you have any Grain to sell, better arrange to sell as we cannot pay prices we are paying now very much longer.

Prices will be lower as soon as Grain is offering freely.
 Sell yours while the price is up. Drive your loads direct to our Elevator.

Business Hours—8 a. m. to 5 p. m.

ROB ROY MILLS, Limited

Durham Meat Market

Terms, CASH. PHONE 94

We are open for business next door to McIlraith's Shoe Store and solicit the patronage of the citizens of Durham and vicinity.

Try our own Cooked Meats,
 Headcheese, Sausage, Homemade Beef Dripping, Etc.

Smoked Rolls and all kinds of Cured Meats on hand

Delivery to all parts of the Town. Give us a trial. Our prices are right.
