SWINTON PARK

This community was again called upon to pay the last tribute of respect to one long and well known in this locality, through the death of Mrs. McMillan Sr., who died in Fleisherton at the home of her daughter Mrs. Jas. Paton, on Tuesday, April 4th. The funeral was on Friday afternoon to Swinton Park cemetery, Rev. Mr. Fowler of Fleisherton and Rev. C. B. Jones of Priceville conducting a short service at the house, also at the grave.

The roads were in a very bad condition but every home within a large radius was represented at the funeral, thereby showing the esteem in which the departed was held.

Mrs. McMillan's maiden name was Annie Smith and was born in Islay, Scotland 85 years ago and came to Canada at the age of 18 years, along with her parents and other members of the family. They lived for a few years at Acton, then coming about the year 1861 to the Township of Proton, near Cedarville, where she was married 59 years ago to the late Duncan McMillan of McMillan's Corner, 16th son, Proton where a home was established. This was a home and a resting place to many a weary traveller of both high and low estate in the early days.

It was where the first Sunday School was held in this locality and organized by Mr. McMillan. Also the first political meeting was held here and many other meetings for the good of the country.

To them were born three sons and five daughters, Christine a daughter, dying in her early teens and Archie, the youngest son a few years ago who along with Mr. McMillan who died in 1903, lie in Swinton cemetery. Those left to mourn are Kev, Mrs. Paton, Fleisherton; John S. of Cayton; Mary of Ft. William; Nettie, Mrs. Wm Haw of this place; Annie, Mrs. Jas Wilson, Bothville and Ned on the old home farm. There is also one brother, Rev. Gilbert Smith in Michigan and to these are extended all sympathy in their bereavement. But though we feel sad at the loss of our friend so true, still we can rejoice in that she was so long a time with us and that her words and actions at all times, pointed those with whom she associated to a better and purer life.

Department of Agriculture

Sheep Work in 1922

Quite recently the Department of Agriculture, Markdale, received a letter from Mr. Jas. A. Telfer, Sheep Promoter of Western Ontario, Paris, Ontario, re Sheep Extension work for 1922. It says in part as follows: 'Beginning with the week of April 17th, we are prepared to furnish you with two field men, Mr. Howard and Mr. McConnell. These field men are to work under your direction and to carry on demonstrations in docking castrating and shearing until the end of May. During the month of May we will also have a third man whom I should be glad to have assist the sheep raisers in certain communities in the planning of a permanent community Dipping Plant in three or four districts. This plant is to be made of concrete with the assistance of the producers of that community in which it is planned. You will notice that by such action we will be making permanent our former work in this district.

'During the month of June it is proposed that we assist the sheep breeders in the districts in which these permanent tanks have been placed with the dipping of their sheep. All of this work will be conducted as preliminary work leading up to a special sheep and fair sale day, of

days, feeling as I do that such an effort will cover at least two days.' We are doing our utmost to get farmers interested. If any desire help it will be given free of charge. We want to make this year a bumper year in sheep work in Grey County. Farmers we ask your co-operation.

Nitro Culture for Clover Quite a large number of orders for Nitro Culture have been received in the last two weeks. We regret there have not been more but it is not too late to order yet.

Nitro Culture is a preparation made by a gelatinous substance called Agar in which are myriads of Bacteria taken from the little nodules or lumps which grow on the roots of clovers, Alfalfa, Beans and peas.

The Nitro Culture when mixed with milk and poured on the clover seed leaves the bacteria sticking to the seed. These bacteria help the plant to get nitrogen from the air thereby assisting it to grow and at the same time storing more in the roots of the plant.

Nitrogen is the most expensive part of any fertilizer. The farmers who grow the largest crops have a large amount in the soil. That is the benefit of growing clovers. They collect it from the air and deposit it in the soil. No other crops except clovers, alfalfa, peas and beans do this.

Nitro Culture will assist the clovers to get Nitrogen easier. They will grow better. The danger of heaving is lessened and therefore greater crops are assured. It only costs 50 cents per bushel. T. Stewart, Cooper, Agricultural Representative, Markdale, will be pleased to show any farmer how to use it if they let him know when they are ready to sow the clover. He will come right to the farm and do this work for the farmers free of charge.

We are receiving new applications yet. It is not too late for teachers to send in orders. We are expecting at least 170.

We have sent out some material. The rest will go as soon as more seeds arrive. Join now and we will do our best to make the Fairs in Grey County the best yet. If in doubt as to the success of the School Fair compare the lumber engaged with those not engaged. The Department of Agriculture welcomes you.

Tea Shortage Means Higher Prices

During the war tea reached a very high level of cost largely owing to shortage of shipping. In 1919 and 1920, greatly increased production and unlimited shipping resulted in enormous quantities of tea reaching every market in the world, and a consequent fall in cost ensued. So serious did the situation become in India, Ceylon and Java that the various growers agreed to decrease their output during 1921 by 20 per cent. This agreement was kept and the world is now faced by a shortage of tea, which has resulted in the market climbing week by week for the last eighteen months until it has now reached a level fully 15 cents a pound over that of October 1920.

New Postal Rates

On and after April 1, 1922, the rate on money packets to places within Canada, the Empire, United States and Mexico, will be five cents an ounce or fraction thereof, also one cent war tax and ten cents registration fee thereon.

'Money Packets' mean bank notes, coin, bullion, gold dust bands and coupons payable to bearer, stocks and other securities negotiable by bearer. Letter postage to Newfoundland is four cents for first ounce and three cents for each additional ounce or fraction thereof.

GROWING SWEET PEAS

Getting the Very Best From This Beautiful Flower.

Location and Soil Suggested—Early Sowing Desirable—Good Support and Frequent Picking Necessary. (Contributed by Ontario Department of Agriculture, Toronto.)

Location.—An open, sunny position in the garden suits them very well. Close up to a building or near to a close board fence facing the south is not a good place for them as the intense heat of the sun induces attacks of insect pests. An east, west, or north exposure close to a fence is not so objectionable, except perhaps a direct northern exposure. Near to an open wire fence or trellis fence is not objectionable.

Soil.—A deep, fairly rich loamy soil is best. If the ground is poor or gravelly or heavy clay, dig a trench the length required from 12 to 15 inches deep and about 10 inches wide. Place about two inches in depth of well rooted barnyard manure or cow manure in the bottom of the trench, then fill the trench up with well enriched loamy soil. Deep digging is necessary for sweet peas even in good soil. Never sow sweet peas twice in succession in the same soil; a part of the soil at least should be renewed every year. Prepare trench or ground for sweet peas the previous fall if possible.

When to Sow.—Sow as early in the spring as the ground can be worked. The seed may be soaked in lukewarm water before sowing for six or eight hours to hasten germination.

How to Sow.—Make a drill about two inches in depth. Sow the seed about two inches apart. Cover with nearly two inches of fine soil. (The Spencer type of Sweet Peas is the best kind to sow.)

Thinning.—Thin the plants when about six inches in height to three or four inches apart. Support.—Wide meshed chicken wire five feet in height, made of brush-wood or coarse twine may be used for support. Netting made of coarse twine makes an ideal support, better than wire, as the plants cling to it better than to wire.

Watering.—Water thoroughly in very dry weather. Draw a drill a few inches deep and about four inches from the row on each side. Pour water into these until the ground is thoroughly soaked. Watering in this way once every week or ten days is far more beneficial than frequent light surface waterings. Frequent light surface waterings under pressure from a water-sprinkler every day in hot dry weather, to keep down insects, such as green aphid and red spider. Sprinkle the under side of the foliage especially. Tobacco and soap solutions are also good for insect pests.

Picking Bloom.—Keep all the sprays of bloom picked off every second day to prevent seed from forming. If seed is allowed to form, the bloom will be inferior and the flowering season of short duration.

Fertilizers.—A watering once or twice with liquid manure will help to keep the plants vigorous and productive late in the season.—The late Wm. Hunt, O. A. College, Guelph.

Silo Facts.

In the silo you can store corn in a form in which practically every particle can be eaten. Silage gives the effect of pasturage in winter; it is both palatable and succulent, and it also aids digestion in the dry-feeding season. Animals fed silage are not more subject to tuberculosis, are not shorter-lived than animals fed other common kinds of feed.

The use of the silo often makes it possible to save corn that would otherwise be lost by frost. A good silo should be round, airtight, water-proof, have walls that are smooth inside, and be strong and durable.

A silo should be placed where it will give the greatest convenience in feeding and where it will be least exposed to extremely cold winds. One hundred tons of silage will feed 25 cows 40 pounds of silage a day for 200 days. A silo 14 feet in diameter and 32 feet high will hold 100 tons. Silos of more than 100 tons capacity cost from \$2 to \$4 per ton, according to the type and material used in construction.

Farm Notes.

Michigan is the first state to offer a reward for planting nut trees beside highways. In Europe the profit from roadside nut trees assists in maintaining roads. Roadside nut trees abroad are protected from vandalism by public sentiment, and this is true of the nut orchards in the principal centre of production in America.

By means of a potato cutter, a potato planter, and a potato digger, along with other machines, a farmer has been able to produce 57 bushels of potatoes with one average hour's labor. A half century ago the product was only one-third as much, says the United States Department of Agriculture.

Noah Up to Date.

From the time of Noah when the dove brought the green beck, homing pigeons have been of constant service to mankind. That well-bred stock of this breed is desirable is shown by a live-stock owner in Henrico County, Va. He has 22 homing pigeons of pure breeding among other live stock enrolled in the Better Birds.
