Smiting on the face was a common ve also to them likewise." form of insult in the East. It was an insult rather than an injury, "Even a slave would rather be scourged than buffeted. The law imposed a fine for the first buffet and a double fine for the second. This command of Jesus is not meant to prevent one from defending the weak and helpless from the tyranny of the violent. The blow that is struck in defence of the weak of wanton violence. Jesus means that the spirit of the Christian is not to be the spirit of mere retaliation. There is to be a different motive. Him that taketh away thy cloke . . thy coat also. The law provided that the outer raiment of a debtor might be seized as a pledge. But Jesus says that if one took the cloke or outer robe from his follower, he is to let him have his coat or inner garment also. Again it is principle, not the particular command that is important. Just as personal rights are not the supreme thing, so also legal rights must sometimes be surrendered for love's sake.

V. 30. Give to every man . . . ask them not again. This command shows still more clearly that Jesus is dealing with principles. A literal fulfilment of this command would involve indiscriminate giving with its inevitable results of evil. The saintly William Law is said to have demoralized his whole neighborhood by the literal fulfilment of this command. Jesus assumes that his followers will have common sense as well as love, and that they will understand the difference between meekness and weakness the difference between kindness and softness. He trusts them to remember his other corrective words-"Give not that which is hely unto the dogs. neither cast ye your pearls before ewine, lest they trample them under their feet, and turn again and rend

OUR INSECT ENEMIES

Undoubtedly there was a time when the sabre-tooth tiger and the cave bear and the poisonous serpents threatened the very existence of the infant human race. Man thought of the beasts of prey as his dangerous enemies; insects were nothing more to him than a continual annoyance. But he long ago won his battle with the reptiles and the carnivora. He won it with bow and spear, and the invention of firearms has made it possible for him to exterminate any species that he thinks it worth his while to wipe out. His real struggle to-day is with the swarming billions of tiny insects and parasites that carry disease or threaten to consume the plants that are necessary to his life and comfort.

The mosquito, which spreads malaria or yellow fever, the flea, which carries the bubonic plague, the louse, which transmits typhus fever, the boll weevil, which ravages the cotton fields, the corn borer, which menaces one of our greatest food crops, the scale insect, which kills our fruit trees-those and other tiny creatures like them are the natural enemies of the human race, against which we must be prepared to wage an unremitting warfare.

Such pests are so minute and so credibly prolific that at first it seem quite hopeless to think of exterminating them, says a writer in Youth's Companion. But Dr. Felt, the state entomologist of New York, says that it is at least possible to keep down the numbers of most insects to a point where they can do little harm, and where they are even in danger of complete extermination by natural causes. That can be done only after a careful study of the conditions that then by 'nterfering to produce conditions that are unfavorable. The malaria mosquito, for example, has been virtually exterminated in many places water with a film of oil. The larvae rise to the surface through the oil. So, by appropriate measures, the cattle call by telling the history of her ap- tick has been quite cleared out of no

Creatures like the boll weevil and the corn borer are more difficult to reach. It is probable that they can never be wiped out unless nature disease or blight that the insects caneight cows were in the herd for the are three or four other farmers in the ing old-time dresses, three wedding things which have lain in boxes and by the expedient of planting no cotton at all for one year. It would be hard but if it were possible the plan might be efficacious.

Persistent and thorough spraying will overcome some insect enemies; the destruction of trash hears and undergrowth where they breed will keep other species under control. Some, like the corn borer, present a problem as yet unsolved. But the plan of campaign against all those tireless enemies of man is the same. There must be first a careful, scientific study of the life history and the habits of each species, then the widest possible publication of the results of that study, with instructions for attacking it in its breeding places, and finally the intelligent co-operation of public authorities and private citizens in carrying out those instructions. Not many species can be destroyed at one blow. Against most of them the warfare must be continual, the vigilance unremitting; but if man puts his mind and his will to the work, he can get the better of his insect enemies as he has got the better of the savage

They Cut the Cost of Raising Calves.

Many dairymen would like to know how the cost of raising calves might some interesting suggestions along

Six calves were raised successfully by using skim-milk powder in place of ordinary skim-milk. At the age of from whole milk to skim-milk powder. milk powder was gradually withdrawn until in seventy days the calves were on the ration of alfalfa hay and a standard grain mixture. These calves at the age of six months were slighly below normal, but had recovered fully in weight and height two months

Ten pounds of powdered skim-milk added to ninety pounds of water makes one hundred pounds of normal skim-milk. The grain ration fed the calves was compounded by mixing four parts of corn, one of bran an one of linseed

The object in this test was to raise the calves with a minimum amount of whole milk and the experimenters feel they have succeeded in another way also, inasmuch as the powdered milk can be purchased at ten cents per pound, and ten pounds produce one

Weeding is as essential in the herd or the flock as in the garden.
