PLANTING STRAWBERRIES IN LATE SUMMER.

up their new strawberry beds, yet new bed. and early September planting.

some plants may be lost. Where pot fertilization and a crop of fruit. negligible.

In favor of summer planting, where extensively are perfect or bisexual. it is carried out successfully, is the prospect of a small crop of nice berries the following spring. Plants must however, be set out sufficiently early that we can be tolerably certain they will become thoroughly established prior to winter.

It may be necessary to use water freely and regularly after planting, depending upon weather and soil conditions, whereas a mulch of straw or other litter will aid in keeping the soil around the plants moist and cool and so encourage root action.

What we have to fear most from summer planting is the alternate freezing and thawing of the ground during winter and spring, though this can be guarded against to a great extent by mulching the plants, covering them with a good layer of straw or other matter.
