# Appearance of Tea No Guide

The only way to test tea is to taste it. Many people have the idea that a finely rolled and tippy tea is superior in flavour to a large rough leaf. In reality-this is not of necessity the case. The altitude at which the tea plant grows determines the amount of essential oil and alkaloid theine in the leaf. The essential oil gives tea its flavour; the theine contributes the stimulating value. The only way to insure always receiving a uniform quality is to insist upon a skilfully blended and scientifically sealed tea like "SALADA" whose reliability, goodness and delicious flavour have become a household word.

sion for a period of time sufficient to! allow for his trip to the woods and back. Later, he came out and made a home for the doves out of a small box! and some screen wire so they would be safe from cats and other prowlers. As for neighborhood boys, he knew he could steer them away and there was only a slim chance that his father would make the discovery as he rarely ever set foot in the left.

It was no small task to feed the babies at regular intervals. This had to be attended to and it was necessary for Tommy to exercise great care lest he arouse the curiosity of his parents. He also denied himself many hours of play. Long trips away from home were out of the question as he had to stay close to the helpless babies. They seemed always to be hungry.

After a while the lad began to long for the time when his young charges could feed themselves. It was such a tedious job to feed them with his fingers. One tiny morsel at a time. He set about to work out a better

The great annual event in Meadville was at hand: the awarding of the Townsend Foundation medal and cash prize. It was the most auspicious event since the Foundation had begun to function. The Governor was present and had made a speech. Other dignitaries had talked upon various subjects. Though talked half to death, the crowd was happy and excited. Who would be the lucky one? Mrs. Mary Hobson Felton, chairman of the Townsend Foundation, came to the front of the platform. She was also the leading figure on the library

Tommy Feaster, janimed in between his father and mother, blinked bravely and made a last desperate effort to keep awake. He liked Mrs. Felton. She liked to talk with boys. He could tell her almost anything and she the young miss to doff her heavy understood. He could tell her things coat. We answer the call with a cape a while. Honest, Daddy! It was just Tommy listened carefully.

This he continued to do until the doves were large enough to feed themselves. He missed a lot of play and more than once took a punishment because he was afraid to explain why he was not always at home right on time. He was afraid his little orphans, if discovered, might suffer, and that he could not bear. When they were strong and able to fly he let them go, and somewhere to-night there is a pair of living doves because of the thoughtfulness and unselfishness of a little boy. We, therefore, take great pleasure in presenting to Tommy Feaster this medal and the cash prize of five hundred dollars."

Tommy went down the alsle with his medal and the cheque. He was dazed and truly puzzled. If the truth were known he was not the only dazed one there.

Margaret Feaster held her son close and cried into his curly hair. John Feaster put one big hand on the boy's shoulder but his throat was nearly bursting with a lump that grew larger every moment.

There wasn't much to be said when they arrived at home. Tommy was still in too much of a puzzle to talk so he went up to his room. The Feaster household was not at peace with itself. At last John Feaster broke the silence: "Margaret, it's a wonder to me that God is willing to trust little children to some people."

Minard's Liniment Fine for the Half,

says Mrs. Experience, who chooses soap for its economy and laboursaving value.

"Sunlight puts the sunshine of cleanliness into the home! For washing clothes, dishes, wood-work, linoleums, in fact, for anything that can be cleaned with soap and water - I call on Sunlight. And Sunlight does its work so well and leaves everything sweet and clean.

"Sunlight really is economical, too! You see, every bit of it is pure, cleansing soap, containing no filling or hardening materials, which are only waste as far as we women are concerned

"You get greater cleaning value out of a pure laundry soap-and so I say, 'Always keep a good supply of Sunlight on hand'. It really improves with age. And because of its purity, Sunlight is kind to your hands and keeps them smooth and comfortable." Sunlight is made by Lever Brothers Limited, Toronto.

"Oh, John, please don't say that."

and Lourilla Aleroyla!

Sweet and sour cherries alike suf- of fer severely from this disease when y there is considerable wet weather in g May and June. The fungi causing leaf to spot or yellow leaf of sweet and sour d cherries, and the shot hole of plums, T are very closely related. They are f present wherever these fruits are g grown and are commonly found on the wild species of prunus. The main fac- t tor which regulates the amount of e damage they cause, is the weather. W Abundant moisture in May and June of results in heavy infection. Relatively k dry weather often prevents the spread of of these fungi to the extent that no i damage is caused.

Leaf Spot or Yellow

The life history of this fungus post of cherries is simple. The diseased leaves of the past year living on the t ground furnish the place of hibernation. On these dead leaves spore cases a are formed and during wet weather in May and June spores are shot out of to the new leaves above. The same wet periods which cause the spores to be discharged into the air furnish the necessary moisture conditions for the germination of the spores as they adhere to the new leaves. Upon germination the fungus enters the leaf tiesue and at each place of infection small dark blue spots appear in about 4 a dark red or reddish brown. In some cases where infection is slight the spots drop out leaving holes but where a large number of infections have occurred the entire leaf soon turns yellow and falls.

The first infection takes place at about the time the petals fall and perlodic infections may continue for a month or more. Often it happens that the leaves are yellow and falling before the fruit is ripe. In other years the infections accumulate more slowly and the leaves drop later. The most important damage caused is the weakening effect on the entire tree. Defoliation, especially when heavy, prevents the maturing of the new wood of the tree. This may predispose the tree to winter killing the next winter.

Because of its common occurrence

and damaging effects upon the trees I

controlled in every commercial orch-

ard. The first thing that should be

the blossoms are out. Care should be taken to cover as many of the old leaves as possible. In this way the I amount of infection is materially reduced. Spraying with either lime sulphur, or bordeaux, will control this disease. Bordeaux is preferred by many growers. The 4-4-40 formula is strong enough and it is effective against yellow leaf even at weaker strengths. Lime sulphur at the strength of 1 to 40 is effective. Iron sulphate may be added to the lime sulphur at the rate of one and onefourth pounds to 40 gallons. This increases its adhesiveness and prevents burning. In order to avoid the early and often very destructive infections it is advised that the first application be made just as the petals are about all off, or at least a few days later. Another application should be made from two to three weeks later according to the amount of wet weather. A I third application just after the fruit is picked and a fourth, three weeks later, are advised if weather conditions favor infection. Sulphur dust of 90 parts, to 10 parts arsenate of lead is as effective as the liquid sprays
