How to Control Weeds. Thorough and frequent cultivation

of the land is the most effective way to control weeds. The crop rotation should be planned to permit adequate ploughing and cultivation. While many another good rotation may be Breakfast is the most widely dis- mixed with an egg and cold water. used, the following five-year rotation, there is almost no chance for variety enjoy meat, which supplies them with advantage of requiring considerable energy. A colorful dish of jelly satis- cultivation of the land, and on this Almost everyone agrees that the fies the sweet tooth and is excellent account affords a great opportunity of weed killing, the authors point out If, they continue, couch grass is present timothy sod may be plowed about My experiments have been made to August 1, after the hay has been removed; the land should then be disced world's difficult tasks are performed demonstrated that an adequate meal at least once a week until it is posused during the remainder of the fall. In the late fall the land should be again plowed and left rough to expose the roots of the couch grass to the frost. In the following spring the land should be well cultivated before the grain is seeded. After harvest the land should be plowed and cultivated frequently during the fall, plowed again in the late fall and left over the winter.

Other suggestions made regarding the control of the weeds in Bulletin 72 of the Dominion Agricultural Department are that if many weeds, such as mustard or stink-weed are present, it will be found preferable to merely disc or cultivate the corn stubble in preparation for grain rather than plowing and that leaving the land in hay for a number of years is a fairly effective means of controlling some weeds, especially if there is a thick stand of hay. The use of rotted manure on weedy farms rather than unrotted manure is recommended.

Canadian Pork Products on the British Market.

The quality of the Canadian pork products offered on the British market in 1926 showed steady improvement, yet according to the annual Live Stock Market and Meat Trade Review of the Dominion Department of Agriculture, supply was often inadequate in volume to meet the de-Creamed Potatoes mand. Quite often during the year Canadian supplies on the overseas market were so negligible in relation to supplies from other countries as to greatly affect the status of our Baked Potatoes product. At the same time Denmark was marketing very heavy supplies and some other European countries more than doubled their offerings of the previous years and found a gen-Top Milk erally ready market.

In 1926 Canada sold to Britain 90.843.600 pounds of bacon, as compared with 130,503,700 pounds in 1925. There was also a considerable decrease in our export of hams to Britain. It is pointed out in the Review that Canada's reduced exports were entirely due to the shortage in supply, home values being pig crop had been larger its products would still have found a ready market. At the same time the lack of volume of our exports to Britain is

nothing but ground grain or mash, and this fed in hoppers with very limited feedings of chick grain in the litter, the most grain in the litter, the most grain or most in the litter, the most ground grain or most ground grain or limited ground grain or most ground grain or limited ground grain ground grain or limited ground grain or limited ground grain or limited ground grain or limited ground grain ground grain or limited ground grain ground grain or limited ground grain ground grain ground grain or limited ground grain ground grain or limited ground grain gr sources of contamination. It emphasizes the fact that clean milk may be produced under the simplest conditions and with but comparatively crude equipment provided proper care is taken, while even with the most modern facilities a producer may deliver grossly contaminated milk if his methods of handling are careless.

> Don't tell the neighborhood what you are going to do. Get right down to work and let your neighbors guess for themselves. They'll be over soon enough to offer advice, and ten chances to one the neighbor who wants to drop you a hint needs advice badly himself.

Keep ewes about to lamb away from other stock. Provide warm, well-bedded quarters, exposed to the sun, allowing 16 square feet or more of space per sheep. It is desirable to provide lambing pens for ewes whenever possible. These should be 4 ft. 6 in. Both the ewe and lamb should be kept in the lambing pen until the lamb is two or three days
