Sunday School Lesson

June 12. Peter Delivered From Prison. Acts 12: 1-17. Golden Text-Many are the afflictions of the righteous; but the Lord delivereth him out of them all .- Psalm 54: 19.

SUBJECT.

PROVIDENCE, DIVINE AND HUMAN IN THE LIFE OF PETER.

We have described the subject of our lesson as "Providence, Divine and Human, in the Life of Peter." The reason for so doing is, that prayer on the human side corresponds to providence on the divine side. Christians are meant to act as fellow-workers with God in the accomplishing of his divine ends, and they act as such when they serve and pray. In ways unknown to us our prayers, as well as our acts of faith, "come up before God" and become part of the means through which God fulfills his providential purposes.

GARDEN HINTS

SUMMER CARE OF ROSES. According to A. H. Tomlinson, of the Ontario Agricultural College, it is essential to practice pruning with roses right through the summer if the best results are to be obtained. Old flowers, or any dead or weak shoots should be kept removed. In the early part of the season, particularly old flowering shoots when past their best, should be cut back to a strong prominent bud. With teas and sometimes hybrid perpetuals, new flowering wood will at once start to appear. In this case a quick acting fertilizer, such as nitrate of soda, blood manure or acid phosphate, should be distributed over the surface of the soil near the plant. When the season is inclined to be dry, water the rose well after fertilizing. During the growing season, never allow these plants A CHIC FROCK OF DIVERSIFIED to suffer for lack of moisture. For best results roses should be watered

CULTURE OF CELERY From late June to early July is for table use. Plants may be secured the first week in June and should be set out at intervals of a week or so for a continuous crop. A well drained, very rich soil is best. Have plants wet when taken out of flats, and if possible plant into soil that is damp after a rain or watering. Plant six to eight inches apart in double or single rows. During early growth a little nitrate of soda, an ounce dissolved in a gallon of water and sprinkled over a yard of soil is the right proportion, and later depend on has been applied in the spring or the week or so before harvesting bank up with a board, twelve inches wide, laid
