

Modern 'Pimpernel' Assists Austrians

Young Englishman has already succeeded in getting fifteen people out of Nazi-controlled country.

Protection in Vienna has been a modern "Scarlet Pimpernel" who, like the famous namesake in the days of the French Revolution, has not hesitated to smuggle his friends out of the city of terror, which the Austrians have become. This he does in tricking the men described to him, says a London Daily Sketch, a young Englishman, an Austrian in London, whose sister he has rescued.

A mysterious voice "the last ten days," he said, "is constant fear for the safety of the city, who could not get out in time."

He got in touch with his sister and was able to get two days ago I received a telephone message from her who refused to give me my address and was safe in Vienna and telephoned me in Czechoslovakia and told me her name.

I immediately put in a call and told her of the mysterious call. She said to me the man who saved her.

Having Anti-Nazi views, she says whom he had rescued from the city.

Not only Jews he is saving; Catholics and others whose names are known as anti-Nazi, he is saving, and we are in these days, and we are in these days.

Undergoing Difficult Period

of Bank of Canada Says

is No Longer a Prosperous Country

is passing through a difficult period, says the Bank of Canada, said in a report last week.

The bank is a pioneer concern, said the annual directors' report.

It had changed to a more conservative development, and wanted large capital on the scale of the past.

It is to be considered a conservative, and the Dominion Bank, said the report.

Common Moth Is A Dread Enemy

The Pest Should Be Asphyxiated Before It Lays Eggs And Ruins Your Wardrobe.

Of the 10,000 odd insect pests said to infest the North American continent, the common clothes moth is perhaps best known and most reviled.

Yet the moth is, except as an accessory after the fact, rather an innocent creature. It has no predatory instincts, lives but a little while, and eats nothing because it is physically incapable of doing so.

The female of the species is only more deadly than the male because of its habit of laying eggs every day of its one or two weeks of life. It is at the larva stage of life that the moth species devours those things of animal origin on which it finds itself.

Thus it eats wool, silk, feathers and hair, grows by what it feeds on and emerges into the chrysalis stage, at last taking wing after it has cast off its case.

Before The Eggs Are Laid To cut the moth off in its prime one must begin before it starts laying eggs, but since it does this on the first day of its short life, being precocious, there is little time to lose.

There are several ways of battling the moth species other than clapping one's hands at it. These ways are all chemical. You can either repel Mother Moth, asphyxiate her, or put her or her progeny into a lethal chamber.

The modern moth repellent differs much from the Victorian moth ball which was composed of coal tar naphthalene of varying purity, and was only very little less anathema to most humans than to Mother Moth. Now, however, is an aromatic organic chemical, which is easily volatilized and readily aired from the goods, in sufficient concentration, actually asphyxiates the pest. It is, however, quite harmless to humans.

Fumigation Often Needed For things such as furniture, drapes, rugs, etc., the moth can best be thwarted by treatment of the material with a chemical which does not suit the dietary fads of the larva. When ever infestation with moth eggs is suspected ordinary repellents are of little value, and the safest treatment is fumigation with a highly lethal gas.

This can only be carried out by properly equipped fumigators or dry-cleaning establishments now offer a combined cleaning, fumigation and storage service.

Worm Drill If you flash a strong light at night on to a lawn you may see it writhing with emergent worms. Give one tap to the ground and every worm will make two staccato movements, as if at a sergeant's word of command, and within three or four seconds the whole community will have vanished . . .

Their sense of vibration is as acute as the hearing of the thrush that devours them.

HAVE YOU HEARD

Friday the Thirteenth of May Only once in 1938 comes Friday the 13th.

So frightened are the American people at the specter of the figure "13" that one of the largest hotel systems in the United States found it necessary to abolish room 13.

Dr. Beth Wellman, of the Iowa University Child Welfare Station, and Dr. Skeels, psychologist for the Iowa State Board of Control, has discovered that underprivileged children, taken from inadequate environment and placed in foster homes, respond to love, interest and comfort by remarkable intellectual gains.

Duller In Poor Surroundings He finds no correlation between the intelligence of true parents and their children, but notes the longer small boys and girls remain in poor surroundings, the duller they become. He points out that if these children are removed early enough to foster homes they have a good chance to reach normal or superior mental achievement.

Dr. Wellman has recorded that higher intelligence levels are the rule rather than exception following the stimulating atmosphere of nursery schools. Significantly, during summer vacations at home, without the incentive of school and influence of companionship, children show little or no development.

The Best Type of School Miss Wellman studied the later progress of many boys and girls who received careful and sympathetic early training and discovered those transferred to progressive institutions of this type continued to gain in intelligence, while those who entered less progressive schools lost considerable ground.

"Children thrive best," Dr. Wellman concludes, "in schools where they are taught to think for themselves instead of obeying blindly. They do best in groups with children of capabilities as great or better than their own."

Where Big Game Comes To Town It apparently isn't necessary nowadays to go into the jungle to obtain big-game "tags." The big game oblige comes into the cities.

In Abercorn, capital of Northern Rhodesia, a motorist driving along the main street jammed on his brakes—and then accelerated hurriedly—when he saw a leopard standing near the pavement, a few yards from the Government House and the shopping center. The capital has been suffering lately from the activities of leopards in the vicinity of the town. Shortly after the motorist's experience a leopard, believed to be the one he saw, was trapped and killed.

A sum of \$25 is paid to anyone who kills a leopard.

At Sylhet, Assam, a tiger walked into a tea garden. The tiger fancied a worker, who retaliated with a spade. He wasn't very successful, and was badly mauled before other workers killed the tiger with picks and spades.

Correct this Sentence—"Their board is part of their pay," said the employer, "so I give them the best food I can buy."

With Few Exceptions—The Harder the Work the Smaller the Pay.

White Friend—What are you doing now, Sam? Negro—Ah's an exportah.

White Friend—An exportah? Negro—Yes. Ah was freed by the Pullman Company.

Experts Declare Environment Is More Important Than Heredity, In The Development of a Child's Intellect

There is no correlation between the intelligence of children and their parents; and the influence of environment determines growth or decline of children's intellectual development, according to the report of a 15-year study of children by Dr. Harold Skeels and Dr. Beth Wellman, of the Iowa University Child Welfare Station.

Dr. Skeels, psychologist for the Iowa State Board of Control, has discovered that underprivileged children, taken from inadequate environment and placed in foster homes, respond to love, interest and comfort by remarkable intellectual gains.

Duller In Poor Surroundings He finds no correlation between the intelligence of true parents and their children, but notes the longer small boys and girls remain in poor surroundings, the duller they become. He points out that if these children are removed early enough to foster homes they have a good chance to reach normal or superior mental achievement.

Dr. Wellman has recorded that higher intelligence levels are the rule rather than exception following the stimulating atmosphere of nursery schools. Significantly, during summer vacations at home, without the incentive of school and influence of companionship, children show little or no development.

The Best Type of School Miss Wellman studied the later progress of many boys and girls who received careful and sympathetic early training and discovered those transferred to progressive institutions of this type continued to gain in intelligence, while those who entered less progressive schools lost considerable ground.

"Children thrive best," Dr. Wellman concludes, "in schools where they are taught to think for themselves instead of obeying blindly. They do best in groups with children of capabilities as great or better than their own."

HAPPY ROLLING WITH OGDEN'S

If you're looking for a keen partner in rolling-your-own, step out with OGDEN'S Fine Cut Cigarette Tobacco.

Ogden's rolls a happier cigarette—a smoother, cooler, mellower smoke, and wise "roll-your-owners" have proved it. Use the best paper, of course—like "Chanteclair" or "Vogue".

Pipe-smokers! Ask for Ogden's Fine Cut Plug

Yarn Made From Wool and Flax

Opens Up Many New Commercial Possibilities

The production of yarns and fabrics from a mixture of flax and wool has been engaging the attention of the staff of the Textile Department of the University at Leeds, England, for some months past.

Research In Ontario Japan produced rayon for several years at figures with which Canadian and British manufacturers could not compete and the Japanese still have control in Canada of the sale of the cheaper lines of rayons.

The recent report of the Ontario Research Foundation reveals that this department is doing considerable research work in co-operation with the textile industries of this province. Seventy such industries have made use of the facilities provided. The department has many instruments which test fastness of dyed goods in washing, fastness of colored fabrics under light, resistance to abrasion, strength, yarn slippage, shrinkage, etc. The department has perfected methods which reduce shrinkage to a negligible quantity.

Higher Fabric Yield Instead of the retting process of treating the flax, which occupies a period of weeks, the fibre is produced by an aqua-mechanical process which takes only a few hours. In addition, it is said to produce a higher fabric yield, which makes for its cheapness.

A director of the Laneshire firm of textile machinery makers and a Canadian textile engineer have invented the processes, and their experiments in producing flax fibre have stretched over a period of four years. A Laneshire firm of textile machinery makers, which has developed machinery for producing the flax fibre, controls the processes.
