have as yet to learn why this peculiar lay- village bell tolled slowly and sadly. er is formed. As to the period of its first appearance, that is known to precede the fall of the leaf by but a short interval, though indications of its future formation exist from a very early period. The first stage of the development of the leaf, as shown by Eichler, and recently confirmed by Dr. W. R. M'Nab, is constituted by the cess called the "hypophyll," from which, and not directly from the stem itself, the leaf originates. Whether when the leaf falls, the separation takes place immediately from the stem, or between this hypophyll

through the spectroscope. Only the presence of certain substances could produce these solar signs. Again, chemical analysis lays open to our

view the constituent parts of the common

things of life, and imparts to us a thorough knowledge of them, of which we here instance water. There is very little pure water used. That which comes from the clouds has the best claim to be so regarded, but that is contaminated by impurities in the air as it descends. Clear water is not necessarily pure water. All water from springs and wells contains mineral in solution; the latter having a meagre supply and outgo, is usually more strongly impregnated than natural fountains with flowing inlets and outlets. The purest water is found where solid rock, as of granits, forms the bed over which it runs. But waters of springs and transparent rivers, even when filtered, are never pure. Water of average things and to gain a pure knowledge of purity employed for domestic purposes, is solution from twenty to thirty grains to the gallon of solid matter. The water of the river Jorden contains seventy three a cautious generalization from them. grains, and that supplied by the various nineteen and one-half to forty grains. The soon came out all right; and as the people 1. The pure results of science are the impurities that make water injurious to 3. The annuals of science are replete
