Four motor cars, built after the style o To secure traction they have been made extra heavy, weighing, when fully equipped about 60,000 pounds each. Two will have four motors each and the others two motors each hung on trucks. The cars are equipped with the Westinghouse air brake, and have all standard appliances of the steam cars in use by the Consolidated. In addition to a 15-inch gong at the front ends of the motor cars, each of these cars will have

Save for a single feature, there is not the slightest resemblance to the steam locomotive. That feature is the cowcatcher at both ends of the motor cars. It is situated underneath the platforms instead of projecting beyond the body of the locomotive, as with the steam locomotive. The wheels are about the size of the largest wheels used on steam cars, but the axles are considerably heavier to withstand the strain of the

Until the capacities of the motors are fully ascertained it is not known how many cars will be run on a train. It is expected, however, that trains will have from four to nine cars, as occasion may require. The Nantasket Beach branch was chosen for the experiment for the reason that within its limits are condensed most of the difficult problems which will have to be determined to make electricity a successful substitute for steam. The curves are many and sharp and the grades steep. Trains will be run with great frequency in the seven miles beeween Old Colony House
