illustrations that can be given of this extend even to the undertaker, for the that disease until about the first of successful process is the casting of a mould is placed in an unright position.

A CORN PHOTOGRAPHED BY X mould is placed in an upright position, with a core at the lower end ready to be shoved upward. A large lump of the moiten glass is then placed in the bottom of the mould resting on the head of the core.

Shows a small kernel, covered by layers of hard skin. This tiny corn causes keen pain. The only sure means of extracting it, without pain, in a day, is Putnam's Painless Corn Extractor. Sure? Yes. Painless? Yes. Cheap?

When the core is pushed upward the viscous substance flows down about its sides, filling all the space between it and the mould. The glass is allowed to harden partially, and then the core is withdrawn and the mould split off. The product is a splendid piece of glass pipe. uniform in strength and thickness, and perfectly smotch on its surfaces. All the other forms into which the glass is worked are made on precisely the same principle, that of forcing the core upward into a mould. By this method is attained what has hitherto been un-known in glass vessels — uniform strength and thickness.
