

pox in the hair on his head, on the palms of his hands and soles of his feet and even within his nostrils. I am afraid there is a possibility that it might be small pox that he has; but I don't like to set up my lay view against that of two doctors and hope they are right. But the fact remains that one of the day students who went to the College from Kitchener and studied in the same room with Carolus is in the Kitchener Isolation Hospital as a small pox patient and the only other fellow who studied in the same room is sick in the Seminary with a similar eruption. I told the Dr. about this, and while he thought it made the case look a little suspicious, he still was convinced that all that Carolus has is the Chicken-pox. In that case I imagine the diagnosis of the Kitchener boys' disease was incorrect. As a matter of fact it was also first pronounced Chicken pox. None of the other children have taken the disease as yet and we are keeping Carolus isolated as much as possible. However, as none of them have had the Chicken-pox, it is almost too much to hope that they will escape. We had some of the roughest weather over the week end, that we have had all winter. It became very cold Friday with heavy wind which reached 70 miles an hour. This kept up all Friday and Saturday, and though the temperature only reached zero, it was felt more keenly than the much colder weather back in Jan. To-day was somewhat milder and it snowed all day. I would have had snow to shovel, but I paid Storman and Robert to do it for me. Last night
