X-Raying Pigs

months.

They are X-raying pigs at Lacombe Experimental Station, Alta., and no doubt people will wonder why! It is an interesting story and this is how the research men explain the pro-

At the present time in order to get a picture of the genetic possibilities of a litter of pigs it is necessary to take a representative group from the litter, generally four pigs, two barrows and two gilts selected at random, and subject them to a feeding test which culminates in slaughtering the pigs. This test gives a record of the group in rate of gain, feed efficiency, and carcass quality and together with litter size and weaning weight can be used as a basis of selection. Selection, of course, is the basis of improvement. The best pigs from the best performing litters must be selected as breeding stock to produce each succeeding gen-

eration. All of these records, with the exception of carcass quality, can be obtained without slaughtering any pigs. However, carcass quality is possibly the most important record of all. If we are to produce a higher percentage of lean bacon hogs we must select for and improve this characteristic. If we could evaluate accurately the carcass quality of a pig without having to slaughter, we would have a much greater number of pigs to select from and consequently be able to make a better and

faster improvement. Hence, the experimental work in X-raying pigs at Lacombe. A research project is underway to ascertain whether the bacon quality or potentiality of a pig can be determined without slaughtering it, by using X-ray Techniques will have to be developed and studies made of the relationship of the relative fat and lean as measured through X-ray equipment, and the fat and lean as determined by cutting the carcass. This will be done with a large number of pigs at different stages of growth. If a close relationship can be established and the best stage of growth at which to X-ray determined, then a simple measure of the length of the live pig along with the relative fat and lean from an X-ray should give a good estimate of its bacon quality or potential.

With this information, the best pigs in carcass quality could be selected as breeding stock from the best litters from the standpoint of litter size, weaning weight, rate of growth, land feed efficiency. These are the factors which determine economy of production.

This phase of the work has just started at Lacombe, says J. G. Stothart, senior animal husbandman at the Station. It will take some time to appraise all the possibilities. It is another example of research, however, which may contribute importantly in the development of genetically better breeding stock-better from the standpoint of overall economy of production.

Feeding The Beef Cattle

In feeding beef calves individually from weaning at six months of age it has been found that bulls gained most rapidly, steers ranked second and helfers third. The economy of gains was in the same

Unen starting calves on grain feeding at the Experimental Station at Scott, Sask,

the practice followed in most cases is to give two pounds of hav to each pound of grain mixture for the first few weeks. If the hay is not fully consumed the grain mixture is reduced accordingly, and increased later as the calf becomes accustomed to the concentrate.

During the winter of 1953-54 only bulls and heifers were fed individually at the Scott Station. The average gain for 7 bull calves in 174 days was 2.36 pounds per head daily and for seven heifers in 230 days 1.62 pounds. The grain requirement per hundred pounds gain was 446 pounds for bulls and blended with some other fruit. The other extreme, a filling 511 for heifers. The hay was Quality is further associated using too much thickener or tion until the quantity of grain ularity of this product with with high fruit content and the thickening agents. "Miss Markham Fair" CONTEST

The Markham Fair Board is looking forward to naming "MISS MARKHAM FAIR" of 1954. The contest is open to young ladies who have not been in a similar contest before. The prize money is 1st - \$75, 2nd - \$50, and 3rd - \$25. "MISS MARK-HAM FAIR" and the 2nd and 3rd prize winners will be present at the opening ceremonies on Saturday, Oct. 2nd at 2 o'clock, also at the dance in the evening. The judges will be a director of the Walter Thornton Model Agency, Norman Johnson of the Toronto Evening Telegram, and Mrs. Deane Hughes of Unionville.

(Entry Form)

"MISS MARKHAM FAIR" CONTEST ENTRY FORM

Name .. Miss Address

Entrant to be dressed in day time dress. Entrant to be in front of the grandstand in field for judging at 2.30 p.m, on Friday. Oct. 1st. Entry by form or letter to be in hands of Sec'y R. H. Crosby, Markham, by midnight, Sept. 30th.
