A WOMAN'S BACK WAS NOT MADE TO ACHIE

Thousands of Women suffer Untold Misery Every Day with Aching Backs That Really have no Business to Ache.

Under ordinary conditions it ought to be strong and ready to bear the burdens of life. It is hard to do housework with an aching back.

Doan's Kidney Pills will cure you in the same way as they have cured thousands of others.

Doan's Kidney Pills are 50 cents per box or 3 boxes for \$1.25 at all dealers, or will be mailed direct on receipt of price by The Doan Kidney Pill Co., Toronto, Ont.

"CHAMBERLAIN" LIQUEUR

SCOTCH THE SPIRIT OF THE AGE.

Bought A Farm. Sharpton, Jan. 18—We have not much snow, but splendid sleighing.

Sentiment in the States. "In the United States," the speaker went on, "public sentiment has been expressed in the Durbin bill adopted in Congress on June 29, 1906, asserting the paramount rights of the United States against the rights of the State of New York and the riparian owners in the waters of the Niagara River."

Nicholas Spishkoff, coadjutor of the empire from Somers, is starting for America to arouse sympathy for the famine-stricken people of Russia.

THE GREATER CANADA

POWER PRESIDENT'S PROPHECY OF CHEAPER POWER.

Maj.-Gen. F. V. Greene of Buffalo Speaks Eloquently of Canada's Rapid Rise in Wealth, Population and National Importance—Public Demand the Cheapest Possible Power and Preservation of Falls.

"It is not alone in manufactures that cheap power will prove advantageous, but also in lighting, possibly in heating, and certainly in many domestic uses, not alone in the great cities, but in the villages and on the farms. I believe the day is not far distant when practically every house in Ontario within 200 miles of the Niagara River will be lighted by electricity supplied by the power of the great cataract. It will be running the sewing machines, the churning, the ice-cream freezers, the ventilating fans, the house pump, the knife-cleaner and sharpener, the dish-washing machine, the clothes-wringer and other patented devices, and most of other domestic utensils not yet invented, but much thought about at the present time by a multitude of inventors."

Maj.-Gen. Francis V. Greene of Buffalo, a man of national reputation in the United States as an author, military expert, and public official, addressed a large attendance of the members of the Empire Club of Toronto at luncheon the other day on the subject of Niagara power. Gen. Greene is president of the Niagara Construction Co. and of the Ontario & Niagara Power Co., and as such his remarks in regard to the future of the province in the cheapest possible manner a supply of power from Niagara have authoritative weight.

The first portion of Gen. Greene's address was devoted to a thoughtful discussion of the objects of the Empire Club and the probable future of Canada and its relations to Great Britain and the United States.

International Relations. "It behooves my countrymen," said the speaker, "to study these problems with some care and decide what is to be done in the future. It is to be the equal in wealth and population of a great nation. I think the attitude of the United States toward Canada has, in the past, not been wise. There was a time 20 years ago when by the exercise of proper tact we might have secured a position in the market which is completely as our own market. As matters stand now, Canada has no favors to ask of anyone, either on this side of the Atlantic or on the other."

What Cheap Power Will Do. "To come down somewhat to details in regard to the advantages of this power for Ontario, I need only say that the water power of the northern shore of Lake Erie and the western bank of the Niagara River, and that Niagara power can be generated and distributed throughout all that portion of Ontario which lies between Toronto and Windsor at a cost less than power can be produced by steam. To what extent you will use it is for your manufacturers to determine generally, but power is not the only element in the cost of manufacture. Labor, fuel, and transportation are other elements, and these are becoming more important, I believe, than power is, nevertheless, a very important element. In ordinary manufactures I believe a saving of, say, one-half in the cost of power means a saving of from 10 per cent. to 15 per cent. in the cost of the finished product; in the electro-chemical industries, such as aluminum, calcium carbide, carborundum, soda-ash, nitro-cellulose, and other products, the reduction of one-half in the price of power means a reduction of possibly 40 per cent. in the cost of the finished product. Certain industries of this last named class require the very cheapest power, and cannot stand the cost of transmitting it. For such industries special facilities and advantages are present in that portion of Ontario between the Welland Canal and the Niagara River, having the benefit of the lake navigation and five lines of railroads, and power at a price almost unrivalled for cheapness.

What Electricity Will Do. "In other industries, such as agricultural implements, boots and shoes, hardware, textile fabrics, steel and iron works, the price of power is a less important factor, and the business can stand the cost of transmission to the point where such industries are already developed, as they are at so many points in Ontario, rather than to stand the cost of pulling up stakes and moving down to the vicinity of the Niagara River.

"It is not alone in manufactures that cheap power will prove advantageous, but also in lighting, possibly in heating, and certainly in many domestic uses, not alone in the great cities, but in the villages and on the farms. I believe the day is not far distant when practically every house in Ontario without 200 miles of the Niagara River will be lighted by electricity supplied by the power of the great cataract. It will be running the sewing machines, the churning, the ice-cream freezers, the ventilating fans, the house pump, the knife-cleaner and sharpener, the dish-washing machine, the clothes-wringer and other parts of the laundry, and a host of other domestic utensils not yet invented, but much thought about at the present time by a multitude of inventors."

Canadian Surgeons in Chicago. The Chicago British American has this reference to a rising Canadian surgeon: "Canada is coming to the foremost ranks in the medical profession in Chicago. Only last week Dr. Alexander Hugh Ferguson was knighted by the King of Portugal, and now Dr. Frank O. Carter has successfully performed an operation for blindness in Chicago. Only last week Dr. Carter has been the wonder of the medical world. The operation was for cataract with a thickening of the lens capsule, in which the eye was successfully opened and the cataract and the lens capsule removed at the one operation. Dr. Carter is a native of Ontario, and is a nephew of Wm. Wellington, of the nursery firm of Stone & Wellington, of Toronto. He is a graduate of the University of Toronto and immediately after graduating came to Chicago to practice."

Hard on the Fish. Dr. Oaler continues to be epigrammatic and to utter sayings which please the temperance people. Speaking recently at the London Workingmen's College, he said: "If the beer and spirit were dumped into the sea, for a year, the people of England would be infinitely better off. And if all the tobacco were also dumped into the sea, it would be a good thing for the people, but hard on the fish."

UNDER THE ICE.

Sympathetic and Well-Posted Writer Tells of Plants, Animals and Fishes That Thrive There.

When the sensitive marsh puts on her first coat of glistening armor against the threatenings of encroaching winter the life that has remained concealed through the more open days awakens to a new activity. The new ice is clear and honest, and will sound abundant warnings before giving way—quite unlike the thick, deceptive, spongy ice of spring, that breaks when it seems most firm. The first coating will crack noisily and bend unobtrusively, and give a warning with the most musical cadence writes S. T. Wood in The Globe. Sometimes where a more venturesome step makes a deeper indentation the water comes up to protect the submerged vegetation and liberties that have been taken. The fascination of the smooth, undulating, and cracking surface is soon lost in contemplating the beauties of a dimly lit world beneath the ice. In the translucent medium beneath. A close concentrated gaze brings out a varied panorama that the darkness is striving to hide. The long, jointed, and articulated stems of the white buttercup hang in the water with a profusion suggesting tropical vegetation. These aquatic growths, that send up from the marshy surface in summer, rise and flourish in the water, bearing white insignificant flowers, are now the trailing and entangled features of a scene where the rich greens turn to black as the shadows deepen into the perpetual night of the deep, weedy bottom. The floating roots of the bladderwort that send up their stems of yellow flowers in summer help to make the growing vegetation more dense, and "are a few twining and circling stems of the waterlilies to give distinction and character to the submerged landscape.

The still weeds are pushed aside by a slender, cruel-jawed pike, who pauses a moment with leisurely undulating gills and moves stiffly away on his destructive mission. There is life in the lower depths where the weeds slowly move and a form like a mudcat is barely distinguishable for a moment in the surrounding black water. A school of minnows swims in the middle depth some small, non-descript fish seem almost transparent in the dim light as they dart restlessly here and there in the past in the formation of coal and oil and gas, is now manifested in the tides and the winds, and in the future will be chiefly utilized in the energy producing uses of electricity. The use of the energy of falling water is as old as history itself, but until near the beginning of the present century its application was limited to a few hundred yards from the spot where the water fell. Now by converting the hydraulic energy into electricity and by putting in that electricity an enormous amount of power can be transmitted at least two hundred miles to advantage; and if the electrical progress as much in the next ten years as it has in the last ten years, it will be feasible to transmit 1,500 miles.

What Cheap Power Will Do. "To come down somewhat to details in regard to the advantages of this power for Ontario, I need only say that the water power of the northern shore of Lake Erie and the western bank of the Niagara River, and that Niagara power can be generated and distributed throughout all that portion of Ontario which lies between Toronto and Windsor at a cost less than power can be produced by steam.
