Factory Act.

The factory act of Ontario is, on the whole, antiquated. In the year 1907 a special committee of the legislature, including members from both sides of the house and two cabinet ministers, considered the existng factory legislation, reported that it was entirely inadequate, and recommended that a comprehensive measure should be introduced at the next session. The report concluded as follows:-

"Your committee recognize fact that at this late stage of the session a revision of the law is impracticable in 1907. They, therefore, submit their recommendations for consideration during recess, with the view to a comprehensive measure, dealing with the whole subject of factory and shop inspection, being brought down at the next ses sion of the legislature."

Although a few amendments, of more or less importance, were passed, the sessions of 1908, 1909, 1910 1911, and 1912 all passed without a comprehensive measure dealing with the whole subject being brought

At the session of 1913, the government, through its minister of agriculture, announced its intention of revising the factory act. It was expected that after six years' neglect and delay, radical and far-reaching changes would be made. In spite of the protest, however, not only of the liberal party, but of the workmen themselves, the government put through a bill, which, in its essentials, except in a few respects, resembles the old and outworn legisla-

Specific Proposals.

Mr. Rowell and the liberals and Allan Studholme, labor member for East Hamilton, worked hard to secure and introduce amendments for the following, among other reforms The appointment of additional female factory inspectors.

That no child under fourteen years of age shall be employed in any fac-

That no child under fourteen years of age shall be employed in any shop. That a factory inspector shall have power to prevent the employment of any child at work for which it appears to be physically unfit.

That the lieutenant-governor-incouncil shall by statute issue a prolamation defining hazardous and dangerous occupations,

That the hours of employment for children be limited to eight hours a day, and not more than forty-eight hours a week, and of all youths and young girls to nine hours a day, or ifty-four hours a week.

That the provisions in the exist-

ing law providing that the "custom or exigencies of a trade" may permit youths or young girls to be employed beyond the prescribed time, be stricken out. That no child, youth or young girl

under the age of eighteen years shall be employed in any basement or any part of a factory or shop building elow the surface of the ground. That no child, even of legal age, shall be permitted to be employed in

any factory or shop, who cannot pro-duce a proper school certificate. That no one under eighteen years of age should be allowed to run an

ernment veted them down, and voted against the working men, working women, working youths and working girls.

A CONSTANT MENACE.

Ocean Liners.

The presence of ice menace to the navigator. Its movements, often fairly rapid when prothat at least she had succeeded in pelled by wind and current, make its position always uncertain. One ship another, passing over the same route a few days later, may never encounter. Only those who have stood on the bridge of an Atlantic liner with her officers on a dark night when in the region where ice may appear can appreciate the anxiety of those tireless men, who know that collision with even a small floating ice mass means damage to the ship. The small masses called "growlers" often means greater danger. They float low in the water, leaving little above to be seen by

the lookout. Arctic ice is great solidity and very pregular in shape. Frequently it presents sharp edges which can the plates of a ship, shear off rivets or drive a hole through the bottom as readily as a steel knife. The game of chance is, therefore, played by every ship that speeds through the ice area at night or in a fog.

To those skippers who have had many years of experience in navigating its presence is made known by a number of effects. Before ice can be actually seen there is a peculiar whiteness observed around the berg on a dark night, except in the case of dark bergs. Mariners call this the ice "blink." It is caused by the reflection of the scattered rays of light from the sky by the white surface of the berg. Thus it is a contrast between the black surface of the water, which reflects none of the light, and the ice. which scatters the light, and ice, which scatters nearly all of it. A dark berg s one casting a shadow toward the ship. When the light comes more strongly from any particular part of the sky the iceberg often cannot be seen in certain directions, while clearly bisible by the ice blink in others. This is said to be the reason why the officers of the ill-fated Titanic did not see the berg soon enough to stop. As ice is approached, too, the tem perature of the air usually falls and the marines describe a peculiar damp cold, as distinguished by the cool caused by, a change of wind. Ice bergs are sometimes detected also, by ave echo from the steam whistles of fog horn. Then they are frequently heard for many miles by the noice they make in breaking up or falling to pieces. The cracking of the ice or the falling of huge chunks into the sea cause a noice like distant thunder. Yet despite all these ways of discovery, the presence of ice during certain seasons is a constant menace to to those who cross the sea, as the wreck of many a good ship goes What's Coming Next?
