Soldering Operations.

Not Difficult And Well Worth Knowing About.

IF A WIRE BREAKS and has to be spliced or a cable terminal

comes loose, if a gasoline or oil pipe splits or breaks away from one of its fittings, if the metal float of the carburetor or vacuum-tank springs

a leak or a seam opens in the sheet metal header of the radiator and in

many other similar emergencies, soldering is the method of repair and the motorist may well have on hand the few tools and materials required and possess the slight knowledge needed to do such work himself. The outfit should consist of a medium sized soldering "iron" or,

still better, both one of a moderate size and a small one for finer work.

and a gasoline blow torch for heating the irons and for "sweating"

operations. If electric irons are used or if a gas stove is handy, the torch can be dispensed with. Some half-and-half solder, preferably of the wire form, soldering paste (flux) for use on brass and copper and a little "acid" for iron and steel operations, a few files and a scraper

or two (old knives being good enough) and emery cloth. Here are the

most essential facts regarding soldering: Melted solder will not unite

two surfaces, unless both of them are absolutely clean and bright and flux and acid are merely to keep them free from oxidation, when heated,

soldering will not unite metal parts unless they are both hot enough

to melt solder. Tanks or pipes cannot be soldered while there is liquid in them, nor can large metal pieces be soldered with a small iron, be-

cause in both instances the heat is conducted away too fast to secure

the melting temperature. Heating cannot be effected with a dirty fron.

as its oxidized surfaces will not conduct heat enough to the work. Parts

much of a gap, and any but very small holes in sheet metal must be closed

by soldering small pieces of metal over them, rather than by trying to

fill them with molten solder. The fron must never be heated so hot as

soldered together must be in contact, as solder will not bridge

Call for them by name, It is your safeguard.

MARK ABLETT, bachelor proprietor of The Red House, had arrived and been ushered into Mark's office, a shot was heard.

GO ON WITH THE STORY CHAPTER V

housekeeper's room had give him time?" this time, and Audrey had had again to the lawns at the back, and a busy time explaining to other members of the staff exactly what he had said, and what she had said. The details were not quite established yet, but this much at least was cortain: that Mr. Mark's brother had shot himself and spirited Mr. Mark away, and that Audrey had seen at once that he was that sort of man when she opened the door to him. Elsie had a contribution of her own to make. She had actually heard Mr. Mark in the office, threatening his brother.

"He said, I heard him say it with my own ears, 'It's my turn now,' he said, triumphant-like." "Well, if you think that's a threat, dear, you're very particular, I must

But Audrey remembered Elsie's words when she was in front of Inspector Birch. She gave her own evidence with the readiness of one who had already repeated it several

sleuthhound. I shall begin today." Whatever Antony Gillingham's other qualifications for his new profession, he had at any rate a brain which worked clearly and quickly.
And this clear brain of his had already told him that he was the only person in the house at that moment who was unhandicapped in the search for truth. The inspector had a man missing. It was extremely probable, no doubt, that the missing man had shot the dead man. But it was more than extremely probable, it was almost certain that the inspector would start with the idea that this extremely probable solution was the one true solution, and that, in consequence, he would be less disposed to consider without prejudice any other solution.

Inspector Birch was certainly prepared to believe that Mark had shot his brother. Robert had been shown into the office (witness Audrey); Mark had gone in to Robert (witness Cayley); Mark and Robert had been leard talking (witness Elsie); there was a shot (witness everybody); the room had been entered and Robert's body had been found (witness Cayley and Gillingham). And Mark had killed his brother: accidentally.

to reduce the solder on it to dross, and if this happens, its surfaces must be filed down to bright copper, flux applied to them and then "tinned" over by applying solder to them. Whenever practicable, better results are generally obtained by heating the parts directly with a blow torch and applying the stick of solder itself to the desired point of union, tania has no coal bunkers; she burns judge." He believed the best jury rather than using the iron. (To be continued.) oil. But more important than that; would be one composed entirely of FUEL ECONOMY OF FOREIGN | GENERATOR WON'T PICK UP theatrical people. In England, "Just before I left the other side where there has been stage censor-G. B. H. writes: A friend of mine, who has just been doing I bet Sir Thomas 'tuppence ha'pen- ship for years, he said he is the only some motor touring across the wany to ninepence that the Mauretania artist who is not required to submit

would, if American motorists would buy and use the cars after they were produced. The typical European car is not only smaller and lighter than the average American would it be possible to make it pick up by passing an outside current through the field coils?

Answer: If you start the ensure and lighter than the average American would it be possible to make it.

and lighter than the average American car, but its engine is extremely small compared with that on the American car, and usually of only four cylinders. It is so small that it has to be run at nearly full throttle most of the time and thus has a high fuel economy as compared with the much larger American engine, which is usually operated closely throttled. The smallfness of the European engine of course calls for frequent use of the lower sears while the American car takes nearly everything on "high." If American motorists would put up with smaller cars and tolerate lots of gear shifting, their gasoline economy would be as high as the European's.

Guestions of general interest to the motorist will be answered by and its cut-out cover and touch the field wind ing the battery will flow back through the battery will flow back through the generator field (if its circuit is complete) and, if the armature is all right, the generator should pick up. However, if what you say about the condition of this generated is correct, it ought to generate, without this outside excitation. Perhaps a light sanding of the commutator or a little extra pressure on the brushes would help it to do so. We presume from what you say that you have really tested out the field winding for continuity and the armature winding for freedom from shorts, but if not, you better have this done.

Questions of general interest to the motorist will be answered by Mr. Clough in this column, space permitting. If an immediate answer is desired, enclose self-addressed, stamped envelope.
