### The Last of Table Rock at Niagara-The Working of the Falls.

The Falls of Niagara are gradually moving | cotton manufactory (say of 200 fooms) into up stream. According to our telegraph advices of vesterday the last of Table Rock has tumbled in. It was inevitable; it had to go Nothing could be more simple than the work of excavation which from time immemoria has been going on at Niagara Falls. Almos every year, and frequently several times in a year, some portion of the shelf over which the river plunges tumbles into the chasm below. " dreating some visible change in the grand curve of the Horse Shoe or in the irregular line of the American Fall.

The process, as we have said, is execcedingby simple. The general level of the country of Lake Ontario is some three hundred feet lower than that of Lake Erie. The depression is abruptly marked by a terrace drawn neross Niagrra river near Lake Ontario, from which lake said terrace appears like a mountain ridge stretching across the country, the summit of this ridge forming the level of the country of Lake Erie. In the original outflow from Eric to Ontario, then, the river was very naturally precipitated over this terrace : down the side of a mountain. But soon the fall became perpendicular, as the geological structure of this upper country will show in a glance at the sides of the chasm below the present Falls.

From Lake Erie to the descent near Onta rio the first formation under the arable soil is a mass of primitive limestene from eighty to one hundred feet thick. Underneath this a friable slate or shale succeeds, which is undeclined by sand, &c. The river finds it a slow business to grind down this immens soverlapping plate of limestone, but the work of excavation is easy by the simple process of undermining it. The stream at first falling over the terrace washed away the loose materials at the base, and, from the tremendous overtopping layer of limestone was left projecting like a shelf across the stream, over which the mighty mass of waters was thrown into the chasm below. But as the work of disintegration went on underneath, and as the pulverized materials were washed away, this impending shelf of limestone, from its superincumbent weight, broke off and fell into the basin; and thus the Niagara Falls have un-Coubtedly been working their way up stream for several thousand years.

In this way the deep and narrow gorge, or canon, of some nine or ten miles from the Falls to the lower country has been cut out. The messes of rocks which form the fearful rapids dewn this awful passage are but the fragments from the common level of the cliffs, which on each side indicate a solid body of limestone. of from eighty to one hundred feet in thickness. The same process accounts for the table rock and its fall. In the course of years another table rock will thus be formed, projecting over the water, and admitting of a state passage under it between the falling river in front and the crumbling wall behind it; but this, too, as its basis is removed, will, from the elementary laws of gravitation, tumble into the gulf

The work of retrogradation at Niagara is slower, as we should judge, at this time than ever before. The intervention of an island has divided the stream, and the great width of The Canadian branch alone has diminished the exeavating force of the river to less than half its power when the Falls were a mile lower down, and the whole overplus of Lake Eric was concentrated into a channel of some 800 the Falls now is extended to nearly a mile. body of water passes over the American chanof a mile or more behind the Canadian, from the same cause-the lack of the motive power

We are happy to observe that our townsmen are beginning to take a more lively inserest in the developement of the natural advantages which Providence has so lavishly in reply, if he would be satisfied if the fact bestowed on Paris. The hydraulic privileless afforded by the noble river which flows ges, afforded by the noble river which flows ges, afforded by the noble river which flows | would. Kerley then told him to leave the and she came to anchor in the Bay. # LECTURES:

LECTURE on PHYSIOLOGY and PHRENOLOGY will be delivered at the City Hall on Tuesday evening, October 4th, commencing at half-past 7 o'clock pre-

cisely. Doors open at 7. Admission free. This is one of a course which will be illustrated by means of a full-sized French Manakin -- a likeness of the human body so constructed as to be capable of being taken to pieces and again put together, showing the vital organs life-like, and equal to a dissection the United States Wharf this Afternoon, at 41 of the human body. With the Manakin will be used two Skeletons, besides a large cabinet of Paintings-philosophers, fools, poets, painters, &c .- with Bust and Skulls of men and animals, -forming an item of great attraction to the intelligent and curious.

In the exhibition will be nothing indelicate; ladies as well as gentlemen are invited to attend; those who fail of so doing will, we think, United States Wharf for Cape Vincent at eventually regret it as the missing of an intellectual treat.

> ed not to touch any of the material. A. O'LEARY. Kingston, 3rd October, 1853. GRAND TRUNK RAILWAY,

RINGSTON DISTRICT. UROSS TIE SLEEPERS.
