About It.

The Opinions Of A Man Who Knows Much In almost every book I take up on physical science force is confounded with energy, as though words of equivalent meaning, whereas, as representatives of two very opposite things, they ought to be kept separate in our writings as in our thoughts-the one being the very converse of the other; the one aggregative; the other separative; the one combining matter with matter; the other separating matter from matter; the one always doing while the other is, as continually, undoing what the first has done; the one, the force of gravitation, say; the other, say, the separative energy of heat—the two powers, by their coaseless alternative antagonism, keeping the world and all worlds in a state of activity; or, to use a slang phrase. keeping things lively all round. To take a special cies, by way of illu-tra tion, I will suppose that a mass of iron litted to a very great height above the earth by the separative energy of powder (really of heat) falls on to a vast mass of from on the earth, the re-ula of which will be the production of great heat heat intense in exact proportion to the height to which the mass of iron had been forced up, i.e., to the exact measure of its separation from the earth-which, if sufficiently great, would even split up the iron mass into its several constituent inolecules, reducing it to a very gas of iron particles. I am quite aware that I am repeating myself here, but the matter is of such deep importance that no amount of time is illspent in getting a full mastery of it. for we read continually of the electric flame and current electricity, as though they terrific energies to boot.
